

IoT & Wearable Tech

Transforming Business with IoT & Wearable Tech

Billions of IoT devices and Wearable technologies are being deployed globally each year, and in the process, they are transforming everything from consumer electronics through to healthcare, construction, manufacturing and infrastructure management. In this new era of connected devices, sensors and technology, IT leaders need to reconsider how best to deploy and manage cellular connectivity to ensure that IoT transformation doesn't come at the cost of network security or the loss of confidential customer and corporate data.

Simovate can help. At Simovate we help Enterprise IT leaders to blend the right combination of 4G, 5G and IoT mobile networks and next generation data networking technologies to address these challenges. Inspiring innovative new ways to securely deploy and manage remote devices with the use of private mobile networking technologies. Helping to remove the security risks that can come with deploying IoT devices with public internet-facing cellular services; whilst also providing IT teams with enhanced control and visibility of the network, enabling improved device and network management.

IT Challenges

This rapidly transforming environment, creates a new range of challenges for IT leaders and teams:

- Delivering high quality and scalable connectivity that can keep IoT and Wearable technology connected across a variety of locations.
- Ensuring that IT teams can securely and effectively access devices and technology to enable cost effective remote support.
- Providing secure and real time rapid transfer of confidential data to communicate with company systems and to update sensor, tracking and location services.
- Making sure that mobile costs and usage don't spiral out of control, at a time when budgets simply have to be met.

Empowering Secure IoT Networks

» Enabling Better Connected IoT Devices

By leveraging 4G, 5G and IoT network services from across all mobile networks, we can help IT teams to deliver high quality cellular connectivity that is tailored to the specific deployment, removing reliance on the services of a single mobile network. All delivered as part of one fully managed service and contract.

Our managed services cover all UK networks, and we can also deliver innovative “Multi-Network” services that can access all UK networks on an intelligent e-SIM, with a wide range of configurable data allowances. Our services can also be deployed across the EU/Europe.

» Improving Business Productivity

By combining the right mobile network with the right networking devices and technologies, we can help IT teams to optimise mobile signal and to streamline support. With all connections managed via a single management console, we enable IT teams to invoke real-time network and performance monitoring, helping to optimise support and network management costs.

» Enhancing Data Security & Control

By applying security and management controls into both the network and device layers of our services, we can help IT teams to address the challenges of connecting IoT devices to corporate systems and data in a range of innovative ways that are not possible with traditional mobile broadband and data services.

With both internet-based services and private mobile networking services (that bypass the public internet entirely) we can help your IT team to reduce mobile worker cyber & security threats, protect IoT devices and wearable tech and associated corporate and customer data, whilst improving remote support capabilities.

Our Simovate Mobile Networking Services include a comprehensive and tailored support package as standard; along with integrated access to a wide range of innovative mobile network, cloud and networking technologies. All delivered by a named team, under one simple service agreement:

- Combine multiple mobile networks & services under one managed contract
- Proactive tariff & usage management including in month data usage alerts & reporting
- Informative management reporting through Utelize’s “Inview Mobile” Portal
- Independent specialist advice on mobile networking, security & technology
- Optional public & private IP addresses - for enhanced network management & control
- Optional managed router & network monitoring - for 24/7 365 remote location support
