START

VIRTUOUS CYCLE

HOW IS THE CORE INGREDIENT IN OUR PEAT-FREE PRODUCTS MADE?

HARVEST

Rye, Maize, and Grass is grown and harvested on our farm in the Somerset countryside.

DIGESTATE LIQUID

DIGESTATE FIBRE

RYE
MAIZE
GRASS

CREATION OF BIOGAS

We feed Maize, Rye and Grass into our anaerobic digestion plant in which they are composted down by natural microbes. This process produces biogas and a by-product natural fertiliser called Digestate.

POWERING THE UK

The renewable Biogas goes to both a power unit which converts it into electricity to power our farm, and it is pumped directly into the national gas grid powering 8000 homes per day with green energy.

DIGESTATE

The Digestate is separated into a fibre (and a liquid) which we bag up and use as the core ingredient for our Compost products. We then provide our customers with all natural and Organic growing media products.

DIGESTATE LIQUID

DIGESTATE FIBRE

NEW HARVEST

After blending and packaging our Organic Compost and Soil Improver products we spread the remaining liquid and fibre onto the fields to grow the next crop of Maize, Rye and Grass, creating a natural and sustainable virtuous cycle.
