ABOUT PELSIS

Pelsis develops leading brands for commercial and retail customers, delivering innovative pest control and garden care products to a global customer base.

Leading brands - Our reputation is built on leading brand heritage, developed with extensive knowledge of our markets and supported by experts in each field. Many of our brands have a number one market position and are built on a reputation of high quality products and support services, alongside innovative new brands developed to meet ever changing trends and needs. We continually work to develop our brands to support our distributors across our territories.

Leading products - Customer insight is at the heart of our product innovation programme, allowing us to develop world class products designed with serviceability, design and quality in mind. Our close working relationships with customers is key to our product development ethos, giving us insight into the needs of our customers and consumers.

Green Protect is a leading retail brand, offering a simple, effective and sustainable route to a pest-free home. Green Protect products help to prevent pests without the use of chemicals, making them ideal for customers looking for a safe and sustainable solution.

www.green-protect.com

Pest-Stop is the UK's leading manufacturer of high quality domestic pest control products for the retail market. The Pest-Stop brand offers a comprehensive range of market-leading products, from the Little Nipper mouse traps, one of the longest standing pest control brand names, to contemporary products designed with the domestic user in mind.

www.pest-stop.co.uk

Insect-O-Cutor is the world's leading flying insect control solutions provider, and has remained at the forefront of technical and design innovation since the brand was founded in 1962.

a **Pelsis Group** Brand  **pelsis**

BEST-SELLING PRODUCTS

Our UK leading products include the Little Nipper, Trip-Trap and Prism.

As pest control specialists our aim is to provide retailers with products that bring our professional knowledge into a consumer environment.

We work very closely with all our customers which is key when it comes to our product development. This allows us to gain essential insight into the needs of our customers and end users.

TECHNICAL EXPERTISE

We are constantly ahead of competitors when it comes to changes in legal requirements and regulations.

We offer leading education and support for customers and end users through various different forms of media including video content.

QUALITY, INNOVATION AND PARTNERSHIP

All our products are sourced, developed and tested by our expert technical and quality teams.

Our business consistently brings professional products and expertise to the retail market.

We work with other market leading brands to offer exclusive distribution on must have brands.

PEST-STOP

Key Pest: Brown Rats

There are two common types of pest rat; the brown rat (*Rattus norvegicus*) and the black rat (*Rattus rattus*). The brown rat is by far the most common, with the black rat being more common around coasts and ports.

Brown rats:

- Carry disease, eat through grain and cause great distress and damage
- Have to chew to keep teeth short – they can chew through almost anything, including concrete and electrical wiring
- Are cautious in nature and will avoid anything new
- Body measure 20-25cm with a tail length of 18-25cm
- Brown or dark grey fur, with relatively small eyes and ears

Key Pest: Mice

The house mouse (*Mus domesticus*) is a common household pest, who makes its presence increasingly known over the winter months and into spring, due to their need to seek out shelter in warm locations. They are however active all year round and will live up to one year in the wild.

Mice:

- Are expert jumpers, climbers and swimmers
- Can squeeze through gaps as small as a pencil
- Cause damage by chewing through wiring and cause distress to many people
- Light to dark brown in colour, hairless ears and tail with large eyes
- Measure 7-10cm with tail length of 5-10cm

Multicatch Traps

Automatic Metal Mouse Trap **PSPAMT**

- High quality galvanised steel humane trap
- Mice are swept into the ventilated capture compartment
- Compassionate solution in areas of high rodent activity
- Clear plastic window for convenient monitoring
- Catches up to 15 mice at a time without harm
- Dimensions (mm): 240 (H) x 200 (W) x 150 (D)

Remember

The Animal Welfare Act 2006 states that a humane trap must be checked at least twice a day. Following the capture of a live rodent, they should be disposed of in a humane way or released into the wild. If these rules are not adhered to this may be considered illegal. If you are unsure how to deal with a captured pest, contact DEFRA, RSPCA or your local vet.

PEST-STOP

RODENTICIDES AND BAIT STATIONS

Rodenticides are an effective way of controlling rodent issues. Pest-Stop has industry leading knowledge to produce high quality rodenticide options with detailed instructions to support the safest and most effective use possible. Rodenticides should always be used within lockable bait stations.

Super Rat & Mouse Killer

Super Rat & Mouse Killer Sachets (6 x 25g) PSSA05

- Ready to use sachets - no need to open or touch bait
- Contains market leading active ingredient - difenacoum
- Aniseed scent - highly attractive to rodents
- Packed into plastic tubs for freshness and security
- Pre-measured wholegrain bait sachets
- Tub dimensions (mm): 118 (H) x 118 (W) x 125 (D)

What active ingredients make up the Pest-Stop product range?

Difenacoum

Difenacoum is more effective for house mice than rats.

It has a higher non-target toxicity making it a good choice for house mice control.

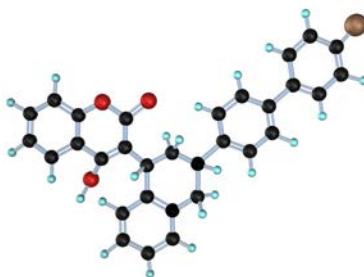

Brodifacoum

The most potent of the anticoagulants for rodent control.

With no known resistance it is highly effective on both rats and mice with a single-feed toxicity.

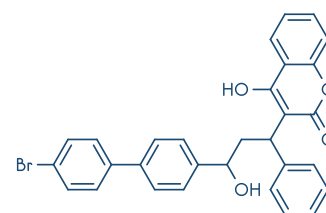

There is a risk of non-target poisoning so it is strongly recommended that Brodifacoum is only used in limited quantities.

Bromadiolone

Bromadiolone is around six times more effective against rats than difenacoum.

There are some known areas of resistance to the second generation anticoagulants difenacoum and bromadiolone in the UK.

Super Mouse Killer Pre-Baited Station

Super Mouse Killer Pasta PSPBMS

- Use bait safely and discreetly
- Locked, single use baited station for mouse control
- Contains market leading active ingredient - difenacoum
- No need to touch the rodenticide

Squirrel Cage PSSCAGE

- High quality, robust, galvanised steel cage
- Reliable trip-plate mechanism safety seals squirrel inside
- Rust resistant
- Carry-handle for easy, protected transportation
- No assembly required, just set and go
- Double entry
- Dimensions: (mm): 610 (H) x 210 (W) x 175 (D)

Inner	6	Minimum Order	6	EAN Code	
Outer	6				5014055001856

Please note:

It is illegal to release captured grey squirrels, minks, or live foxes back into the wild. It is also illegal to release a rabbit onto another person's property. In each case, the captured animal should be humanely killed. For further information, or if there is uncertainty over the correct procedure for release contact DEFRA, the RSPCA, or a local vet.

It is also illegal to use the Larsen Trap to catch other bird species. It is very important to ensure that the decoy bird is fed and watered, provided with shelter and checked on daily basis.

Rabbit Cage PSRABCAGE

- High quality, robust, galvanised steel cage
- Reliable trip-plate mechanism safety seals rabbit inside
- Rust resistant and reusable
- No assembly required, just set and go

PEST-STOP

What are electromagnetic waves and how do they work?

Electromagnetic waves are the result of the creation of vibrations between electrical and magnetic fields. The waves from both the electronic field and magnetic fields will always be perpendicular i.e. at right angles to each other.

Electromagnetic waves can be categorised into different frequencies and this is more commonly known as the electronic spectrum.

Did you know wavelengths of this can vary across the spectrum ranging from 10-15nm to more than 104nm!

What does this mean in relation to the Pest-Stop Indoor Repellers?

The below table will show our current coverage for the Indoor Repeller range

	One Room	Small House	Large House
Coverage – Ultrasonic	1,000 sq ft	1,000 sq ft	1,500 sq ft
Coverage – Electromagnetic	N/A	2,500 sq ft	4,000 sq ft
Repellent characteristics	Ultrasonic	Electromagnetic & ultrasonic	Electromagnetic & ultrasonic
Target species	Rodents & crawling insects	Rodents & crawling insects	Rodents & crawling insects including spiders

What are ultrasonic waves and how do they work?

Ultrasound is a form of acoustic energy that is formed through the sound of waves. This is usually far above the hearing range of humans. The maximum we can detect is circa 20,000 cycles per second, more commonly referred to as 20,000 Hz. This marks the end of the sonic range and the beginning of the ultra-sonic range.

Ultrasonic waves have higher frequencies than normal sound waves but they are shorter in wavelength. This is important because ultra-sonic waves will reflect back to their original source far quickly than regular sound waves which makes them a very useful tool.

Why are our Pest-Stop Ultrasonic Repellers popular?

- ✓ Non-toxic solution
- ✓ Pet safe product options are available
- ✓ They can be battery operated or plugged into the mains
- ✓ Motion sensor tracking available
- ✓ Can be positioned virtually anywhere in the garden from in the ground to wall mounted, depending on the area

Top tip

If you have found pest related activity within your home or garden, use repellers in conjunction with other products such as traps. Use either conventional or humane traps to remove the pests from the affected area and then use the Pest-Stop repellers to make sure the pests do not return.

Key Pest: Moles

Moles are one of the UK's most common mammals although they are rarely seen due to spending the majority of their life within the tunnels they dig underground. They are considered a pest due to the damage they leave in gardens and fields, they can also be found in habitats including fields, woodlands and gardens. Their diet consists of earthworms, beetles and other insects and they must eat the equivalent of their body weight every day.

- Moles can dig up to 18 feet per hour
- Main breeding period is between March and May, each litter has 3-6 young
- Dark fur, no neck, pointed nose, strong claws, used to create tunnels
- Measures: 15cm

Tunnel Mole Trap PSTMOLE

- Improved: now 30% stronger than our previous traps
- Dual entry trap is quick, effective and humane
- Robust, rust resistant and reusable
- Developed and used by professional mole trappers

Pest Identification Guide

Wasps
(*Vespula Vulgaris*)

Size: The common wasp can be between 12-17mm long with black and yellow colouring. The colours are fused together and the head has an anchor pattern. The queens have the same body type but are longer with a length of 20mm.

Habitat & Breeding: The queen typically emerges from hibernation in mid-April to construct between 10-20 chambers where she will lay her eggs. Female workers will then hatch and by late summer a colony can have between 3,000-30,000 wasps. Both males and new queens will emerge in the late summer in which the male wasps will mate with the queens and then later die. It is at this stage the new queens will flee the nest to find hibernation for the winter which is usually inside buildings and/or hollow trees.

- ✓ Can be controlled with Pest-Stop's Mini Smoke and the Wasp & Flying Insect Killer

Flea (Cat or Dog)
(*Ctenocephalides felis/Canis*)

Size: Fleas are usually between 2mm-3mm long in length with their eggs being 0.5mm long, pearly white in colour and oval in shape.

Habitat & Breeding: Fleas are most commonly found around domestic pets and in their bedding. They can also be present in empty premises which have recently been vacated by pets. The development of this pest is dependent on temperature and can range from 8-150 days but usually is between 2 to 3 weeks. They moult twice to grow to be 5mm long and have 13 segments. When fully grown, the larva spins a cocoon with pupation lasting several months or even years.

- ✓ Can be controlled with Pest-Stop's Mini Smoke and the Flea & Crawling Insect Killer

House Fly
(*Musca domestica*)

Size: The common house fly is usually 6mm long with a wingspan of 10mm. Their stomachs are grey/black chequered with black stripes on the thorax. They have veins that bend sharply before reaching the edge of the wing.

Habitat & Breeding: Flies are commonly found in and around areas such as dustbins, compactors and where there are poor hygiene practices. Up to 150 eggs, each 1mm long can be laid in a single batch within foodstuffs. Larvae will begin putrefaction which is spread by the adults with bacteria in their bodies. They will then hatch between 8-48 hours later and they typically pupate in soil. The adult fly will then hatch 3-4 weeks later. An average fly will live for between 25-52 days and is usually found from April to November in the UK.

- ✓ Can be controlled with Pest-Stop's Mini Smoke and the Wasp & Flying Insect Killer

INSECT-O-CUTOR®

Insect-O-Cutor is the world's leading flying insect control solutions provider, and has remained at the forefront of technical and design innovation since the brand was founded in 1962. Offering a comprehensive range of flying insect control products, from electric killing grid flykillers to glueboard devices, flyscreens to decorative units, Insect-O-Cutor provides leading insect prevention and control for a wide range of applications. Insect-O-Cutor is pleased to announce the launch of a new range of fly control products designed specifically for consumers. Trusted by professionals for over 50 years, the unique range of retail flykillers offers consumers effective and discreet fly control solutions for the home and other private premises.

Did you know?

Flies carry many types of bacteria and are responsible for passing diseases to human beings such as Typhoid, Dysentery, Sleeping Sickness and Bubonic Plague

The average number of germs carried on the body of one fly is **1,250,000**

In the summer mating season one pair of flies are capable of producing over **191,000,000** other flies

The common housefly has a flying speed of **5 miles per hour**

A fly can travel as far as **13 miles** from their hatching site

Females can lay **21 batches** of eggs, each batch having up to **130 eggs**

The fly has **4,000** separate lenses in each eye

INSECT-O-CUTOR DISPLAY STAND

The stand has been specifically designed to stock PlusZap, Nomad and Prism flykillers alongside the required lamps, which should be changed every year.

The FSDU fits on a European half pallet. Measurements: W 795mm x D 550mm x H 1400mm (including header card).

Retail stock profile:

63 x Nomad
34 x Prism
30 x Prism Glueboards
12 x Prism Lamps

PlusZap stock profile:

9 x PlusZap 16W
7 x PlusZap 30W
12 x PlusLamp 16W lamps
12 x PlusZap 30W lamps

Full range stock profile:

24 x Nomad
8 x Prism
30 x Prism Glueboards
12 x Prism Lamps
9 x PlusZap 16W
4 x PlusZap 30W

INSECT-O-CUTOR®

PlusZap™

The new third generation PlusZap model offers up to 35% reduction in energy consumption cost* and is 20mm slimmer in design saving on space when installed. In addition, the power cable is now hardwired, improving usability. The PlusZap features staggered lamps to create efficient UV light output whilst the killing grid offers an effective catch area with easy servicing making it ideal for commercial environments.

Features of the PlusZap:

- Slim and discreet design
- Pre-installed powerful UV lamps to attract flies
- Robust aluminium and UV stable plastic construction
- Staggered lamps to create efficient UV light output
- Three simple to install mounting options for wall, desk or ceiling suspension
- Catch tray is simple to remove for quick and safe maintenance, with anti-blow out folds

How often should UV tubes be changed and why?

We recommend that UV tubes are changed every 12 months to ensure maximum efficacy.

The levels of UV produced by fluorescent tubes deteriorates rapidly throughout the life of the tube. Whilst the tube will continue to glow blue indefinitely, after approximately 8,000 hours the amount of useful UV (which humans cannot see) drops to a level where it is no longer attractive to flying insects. As a result, UV tubes must be replaced annually to ensure they remain effective in producing useful levels of UV. This replacement cycle is typically undertaken just before the peak insect season, (March/April within Europe) to ensure the flykiller is producing the maximum amount of UV throughout the critical insect season.

PlusLamp™ 8 Watt 12" 300mm TVX8-12R

- Wavelength: 368nm
- Recommended effective life: 8000 hours or 1 year
- Supplied in retail packaging
- Dimensions (mm): 320 (H) x 18 (W) x 18 (D)

INSECT-O-CUTOR® NOMAD™

OUTDOOR UV LED FLYKILLER AND LAMP

Designed for outdoor use, Insect-O-Cutor Nomad™ features innovative dual blue UV and green LED technology alongside a powerful electric grid to offer protection against a wide range of flying and biting insects.

Nomad NOMAD-UKEU

Specially designed for outdoor use, Insect-O-Cutor Nomad features innovative UV LED technology and a powerful electric grid to offer protection against flying and biting insects.

Nomad's collapsible compact design is ideal for travel and can be used as a bright 200 lumens hanging light with adjustable brightness. Charged via USB (cable included) for up to 18 hours of use*.

- Dual green and blue UV LED technology to attract a wider range of flying insects
- Ideal for outdoor dining, patios, gardens, camping and caravans
- Collapsible compact design, ideal for travel
- Adjustable brightness 200 lumens lamp feature
- USB charged for up to 18 hours of use*
- Dimensions (mm): 121 (H) x 105 (W) x 105 (D)

Test trials have shown that Nomad catches more mosquitoes than a major competitor product on the market. Nomad also has a much higher output of useful UV than the competitor product.
