

TORNADO[®]

At Tornado we have a passion for quality
We work hard every day to make the best fencing

- Better Performance
- Better Installation
- Better lifetime costs

Sheep

Tornado's range of sheep fencing has been engineered to offer maximum strength, security and longevity to help protect your sheep, whilst offering exceptional value with minimal lifetime costs.

We recommend Grant Approved Torus R8/80/22

COUNTRYSIDE
APPROVED
STEWARDSHIP

The R8/80/22 is the "Ultimate Livestock Fence" with 22cm spacing between the vertical stay wires, this increased spacing, over traditional 15cm livestock net, helps prevent sheep getting their heads stuck in the fence. As a "stiff-stay" net R8/80/22 stock fence allows posts to be more widely spaced in grant work than a traditional hinge joint net.

Equine

Tornado's horse fencing has been the choice of horse owners for decades. Investment in the latest manufacturing technology has enabled us to produce a core range of products designed especially for the horse owner.

Our horse fencing products are engineered to give greater durability and extended life, giving you peace of mind and helping to protect your valuable animals for a lower lifetime cost.

We recommend Torus R13/120/5

R13/120/5 combines solid vertical wires "stiff-stays" spaced at 50mm with horizontal line wires spaced at 100mm.

The Torus knot has no sharp edges, this helps to prevent hair or rugs from getting caught by the mesh.

Deer

Large deer populations can damage trees, woodland flora and wildlife habitats. With our comprehensive and innovative range of deer fencing, Tornado has long been the first choice for forest managers looking to protect and preserve their valuable forestry.

We understand that keeping deer safe and secure is the deer farmer's number one priority; Tornado Wire's High Tensile Deer Fencing provides a secure barrier that helps protect valuable stock.

We recommend Torus R13/192/15 for deer exclusion

R13/192/15 features a solid vertical wire commonly referred to as "stiff-stay" and the unobtrusive high pressure bonded Torus knot which does not have any sharp edges.

Clipex

A range of Countryside Stewardship Grant Approved galvanised steel posts to suit Tornado's Torus Livestock, Rail and Deer nets in both Standard 3mm wall thickness and 3.5mm Beefy™. Fencing with Clipex posts can be extremely efficient due to speed of installation, ability to work in difficult access locations, e.g. remote hillsides and the longevity of the hot dip galvanised coating.

Pro-Strain

Tornado's innovative Pro-Strain fencing system has been designed following extensive feedback from some of the UK's top contractors. Pro-Strain is a galvanised steel straining post and strut system using robust components that overcomes many of the limitations of existing systems. It can be easily adapted to give long-lasting, high-performance fence straining in a range of ground conditions and topography.

Torus Nets are Tornado's most popular range of fences, having been widely adopted in the last decade as a great all-round performer. Torus fences all use high tensile line wires so can be tensioned along their full length and will maintain that throughout their long life.

The Torus knot clasps the vertical and horizontal wires together, but leaves no sharp edges. The solid vertical "stiff-stay" wire from top to bottom of the net gives great shape and resilience during installation and service.

Tornado produces a full range of nets to control most animal species.

Trust in TORNADO to deliver

ROBUST: Tornado fencing is designed and manufactured to stand up to the most demanding circumstances

RELIABLE: Tornado quality standards means that our product is consistent

RAPID: Faster to install, hassle-free, allowing fencers to install more metres per day

REASONABLE: Tornado represents great value, with our wide range of fence designs we can optimise performance and installation
