

Leveraging Standards for National Distribution Solutions in Sweden

Background

- ResPlus – enables combined travels with all public transport operators nationally
- It's a cross-industry, voluntary, collaboration with both public and private operators
- There is no government involvement or financing

New solution since 2024

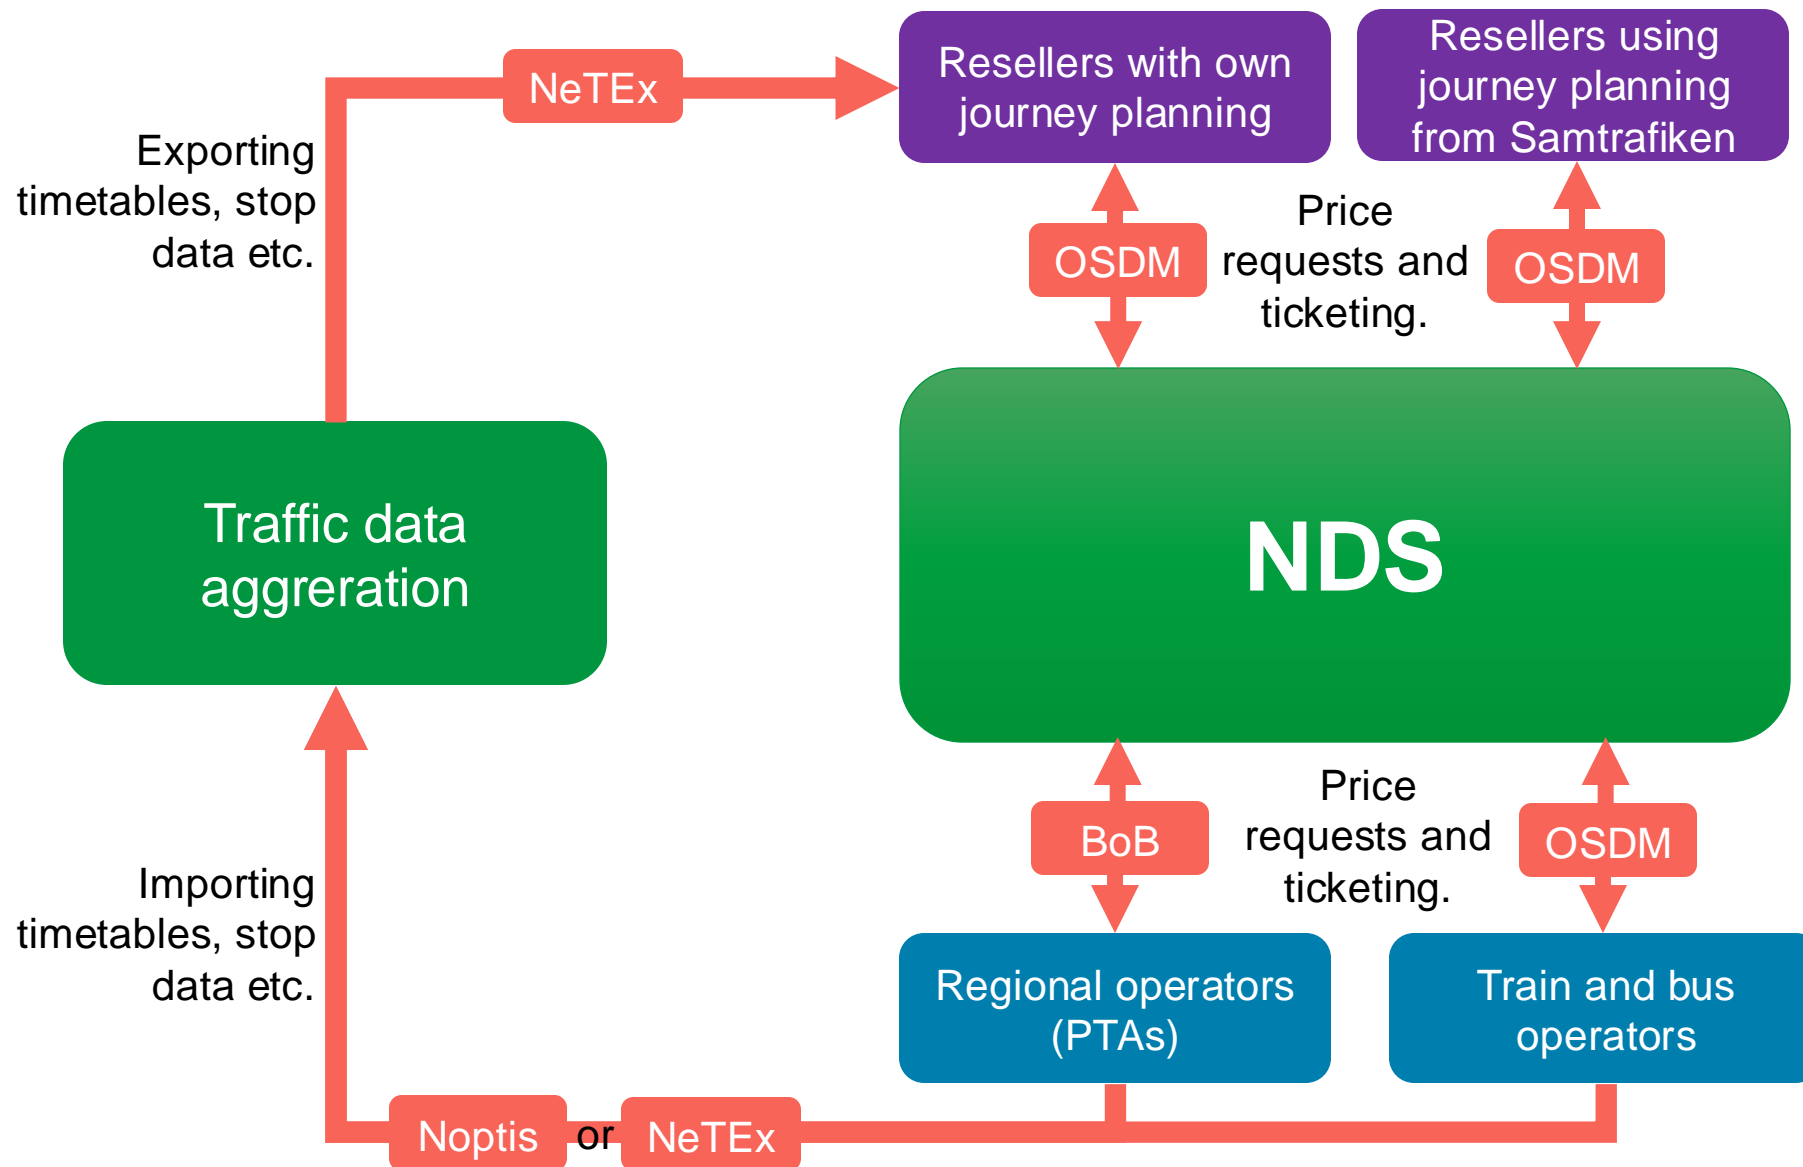

First version live in April 2024. Now under continuing enhancements and improvements.

Goals for the new National Distribution System (NDS):

- A distributed solution to connect many operators ticketing systems to many resellers sales channels enabling combined travels
- The experience of travelling with combined tickets should be equal to any other travel
- Using open standards for an open system and lowering costs

Why NeTEx?

- Open standard regulated by EU for traffic data
- Richer than GTFS and more suited as base for selling tickets
- Data already available as used in the National Access Point (NAP)

Why SIRI?

(Future implementation)

- Open standard regulated by EU for real time data
- Uses the same data model as NeTEx
- Data already available as used in the National Access Point (NAP)

Why OSDM?

- Existing and widely accepted standard for pre booked travels including ticketing
- Developed to handle booked travels with specific departure times and reservations which is true for most ResPlus journeys.

Why BoB?

- Existing open standard for regional public transport implemented by 100% of the Swedish PTAs
- Strong copy protection of mobile tickets
- Developed to handle regional travels with period- and zone-based tickets
