

EXERCISES:

(1)

Statistics show that, of motorists tested for drink-driving, 3% are found to be over the limit. Find, as decimals to three places, the probability that, in a group of thirty drivers tested:

- (i) none will be over the limit

0.401

- (ii) exactly one will be over the limit

0.372

- (iii) at least two will be over the limit.

0.227

(2) A die is loaded in such a way that in 8 throws of the die, the probability of getting 3 even numbers is four times the probability of getting 2 even numbers.

Find the probability that a single throw of the die results in an even number.

(3) An unbiased die is thrown six times. Find the probabilities that the six scores obtained will: (i) be 1, 2, 3, 4, 5, 6 in some order,

$$\frac{5}{324}$$

(ii) have a product which is an even number

$$\frac{63}{64}$$

(iii) consist of exactly two 6's and four odd numbers

$$\frac{5}{192}$$

(iv) be such that a 6 occurs only on the last throw and exactly three of the first five throws result in odd numbers.

$$\frac{5}{216}$$

(4) A given school in a certain State has 3 mathematics teachers. The probability in that State that a mathematics teacher is female is 0.4.

- (a) What is the probability that in the given school there is at least one female mathematics teacher?

0.784

- (b) In the same State the probability that a mathematics teacher (male or female) is a graduate is 0.7. What is the probability that in the given school none of the three mathematics teachers is a female graduate?

0.373

SOLUTIONS:

(1)

(i) Probability = $(0.97)^{30} = 0.401$

(ii) Probability = ${}^{30}C_1(0.97)^{29}(0.03)$
= 0.372

(iii) Probability = $1 - (0.401 + 0.372)$
= 0.227

(2) Let p be the probability of throwing an even number and q be the probability of throwing an odd number.In 8 throws of a die: $P(3 \text{ even numbers}) = \text{term in } p^3 \text{ in the expansion of}$

$$(q + p)^8 = {}^8C_3 q^5 p^3 = 56q^5 p^3.$$

 $P(2 \text{ even numbers}) = \text{term in } p^2 \text{ in the expansion of}$

$$(q + p)^8 = {}^8C_2 q^6 p^2 = 28q^6 p^2 \text{ and since}$$

$$P(3 \text{ even nos}) = 4 \times P(2 \text{ even nos})$$

$$56q^5 p^3 = 4 \times 28q^6 p^2$$

Assuming $p, q \neq 0$ then $p = 2q = 2(1 - p)$

$$\therefore p = P(1 \text{ even number}) = \frac{2}{3}$$

(3) (i) $P(\text{scores will be } 1, 2, 3, 4, 5, 6 \text{ in some order}) = \frac{6!}{6^6} = \frac{5}{224}$

(ii) $P(\text{scores will have a product which is an even number})$
= $1 - P(\text{scores will have a product which is an odd number})$
= $1 - P(\text{all 6 scores are odd numbers})$
= $1 - \left(\frac{1}{2}\right)^6 = \frac{63}{64}$

(iii) $P(\text{scores will consist of exactly two 6's and four odd numbers})$
= ${}^6C_2 \left(\frac{1}{6}\right)^2 \left(\frac{1}{2}\right)^4 = \frac{5}{192}$

(iv) $P(\text{scores will be such that a 6 occurs only on the last throw and exactly three of the first five throws result in odd numbers})$

$$= \frac{1}{6} \times {}^5C_3 \left(\frac{1}{2}\right)^3 \left(\frac{1}{3}\right)^2 = \frac{5}{216}$$

(4) (a) $P(\text{at least one female mathematics teacher})$

$$= 1 - P(\text{no female mathematics teacher})$$

$$= 1 - P(3 \text{ male mathematics teacher})$$

$$= 1 - (0.6)^3 = 0.784$$

(b) Let p = Probability of any teacher being a female graduate

$$= 0.4 \times 0.7 = 0.28$$

$$q = 0.72$$

Using the binomial expansion of $(p + q)^3$

$$\text{Probability of no female graduates} = {}^3C_0 p^0 q^3 = (0.72)^3 = 0.373$$
