3D TRIGONOMETRY

Exercises

37.

ABCD is a triangular pyramid with $BC = 5$ m, $CD = 8$ m, $BD = 11$ m, $AB = AC$ and $\angle ACB = 78^\circ$. Calculate:

- (a) $\angle BCD$;
- (b) length AB (to the nearest metre).

38.

An aeroplane flying at 2000 m is observed to be on a bearing of $314^\circ T$ with an angle of elevation of 29° . After 1 minute it is bearing $020^\circ T$ at an angle of elevation of 25° . Calculate:

- (a) distance AE (to the nearest metre);
- (b) distance DE (to the nearest metre);
- (c) $\angle AED$.
- (d) Hence find the distance the plane travels in that minute and its speed in km/h.

39. A cone has a base diameter of 20 cm and a perpendicular height of 15 cm. Find the vertical angle at the top of the cone.

40.

Calculate the value of α in degrees and minutes.

Trigonometry in 3 dimensions (3 unit) -

SOLUTION

37. (a) $\angle BCD = 113^\circ 35'$ (cosine rule)
 (b) $AB = 12$ m (sine rule)

39. $67^\circ 23'$

38. (a) In $\triangle ABE$

$$\tan 29^\circ = \frac{2000}{AE}$$

$$\therefore AE = \frac{2000}{\tan 29^\circ} \doteq 3608 \text{ m.}$$

- (b) In $\triangle CED$

$$\tan 25^\circ = \frac{2000}{DE}$$

$$\therefore DE = \frac{2000}{\tan 25^\circ} \doteq 4289 \text{ m.}$$

- (c)

In $\triangle ADE$

$$\angle AED = (360^\circ - 314^\circ) + 20^\circ = 66^\circ$$

- (d) In $\triangle ADE$

$$c^2 = a^2 + b^2 - 2ab \cos C,$$

$$\therefore AD^2 = 3608^2 + 4289^2 - 2(3608)(4289) \cos 66^\circ$$

$$= 18\,824\,920$$

$$AD = 4338.8$$

$$AD = BC,$$

\therefore the plane travels 4338.8 m in 1 minute.

$$\text{Speed} = 4338.8 \text{ m, min}$$

$$= 4.3388 \text{ km/min}$$

$$= 4.3388 \times 60 \text{ km/h}$$

$$= 260 \text{ km/h}$$

40. $ZD = YC = 4.1$ m

In $\triangle ZDY$, by Pythagoras' Theorem,

$$DY = \sqrt{4.1^2 + 5.7^2} \doteq 7 \text{ m.}$$

In $\triangle ADY$

$$\tan \alpha = \frac{AD}{DY}$$

$$= \frac{3.2}{7}$$

$$= 0.4557,$$

$$\therefore \alpha = 24^\circ 30'.$$
