QUESTION ONE:

a) $x=\sqrt{2}\sin\theta$ so $dx=\sqrt{2}\cos\theta\,d\theta$

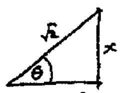
$$\therefore \int \frac{x}{\sqrt{2-x^2}}\,dx = \int \frac{\sqrt{2}\sin\theta\cdot\sqrt{2}\cos\theta\,d\theta}{\sqrt{2-(\sqrt{2}\sin\theta)^2}} = \int\frac{2\sin\theta\cos\theta\,d\theta}{\sqrt{2(1-\sin^2\theta)}} = \int\frac{\sqrt{2}\sin\theta\cos\theta\,d\theta}{\cos\theta} = \int\sqrt{2}\sin\theta\,d\theta$$

$= -\sqrt{2}\cos\theta + c$

$= -\sqrt{2}\cdot\frac{\sqrt{2-x^2}}{\sqrt{2}}+c$

$= -\sqrt{2-x^2}+c$

also



with $\sin\theta=\frac{x}{\sqrt{2}}$

$x^2+y^2=2$

$y^2=2-x^2$

$y=\sqrt{2-x^2}$

$\therefore \cos\theta=\frac{\sqrt{2-x^2}}{\sqrt{2}}$

Marking: ① converting from x to θ, + resolving for $\cos\theta$. ① answer

Comments:
- Some got $dx=\sqrt{2}\cos\theta\,d\theta$, but then left it out of the substitution when changing to θ!!
- very common error was not expressing the indefinite integral back in terms of x; $-\sqrt{2}\cos\theta+c$ got 1 mark.
- $-\sqrt{2}\cos(\sin^{-1}(\frac{x}{\sqrt{2}}))+c$ was also not sufficient for both marks (not simplest form).

b) $\sin(A+B)=\sin A\cos B+\sin B\cos A$ —①

$\sin(A-B)=\sin A\cos B-\sin B\cos A$ —②

$\sin(A+B)+\sin(A+B)=2\sin A\cos B$ ①+②

$$\therefore \int\sin 5x\cos 3x\,dx = \int\tfrac{1}{2}\left(\sin(5x+3x)+\sin(5x-3x)\right)dx = \int\tfrac{1}{2}\sin 8x+\tfrac{1}{2}\sin 2x\,dx$$

$a^2-b^2+2abi = 7+6\sqrt{2}\,i$

equating real and imaginary parts.

$a^2-b^2=7$ —① $\quad 2ab = 6\sqrt{2}$

$\therefore a = \frac{6\sqrt{2}}{2b} = \frac{3\sqrt{2}}{b}$ —②

Marking: ① setup a, b relationship

Comments: · mostly well done. Some students tried to use formulas for finding square roots of complex numbers (not very successfully)

substituting ② in ①:

$\left(\frac{3\sqrt{2}}{b}\right)^2 - b^2 = 7$

$\frac{18}{b^2} - b^2 = 7$

$18 - b^4 = 7b^2$

ie $b^4+7b^2-18=0$

$\therefore (b^2+9)(b^2-2)=0$

$b^2 = 2, -9$

Marking: ① resolve for correct b values

reject $b^2=-9$ as b is real.

$\therefore b = \pm\sqrt{2}$ in ②:

$b=\sqrt{2}$: $a = \frac{3\sqrt{2}}{\sqrt{2}} = 3$ $\qquad b=-\sqrt{2}$: $a = \frac{3\sqrt{2}}{-\sqrt{2}} = -3$

Marking: ① correct roots.

b) i) for $z_1 \parallel z_2$, $\theta = \phi$, $\therefore z_2 = r_2 \operatorname{cis}\theta$

$\therefore \operatorname{cis}\theta = \frac{z_2}{r_2}$

Marking: ① deducing relationship.

$OA + AB = OB$ $\qquad OB + BA = OA$

$\therefore AB = OB - OA = z_2 - z_1$ $\qquad \therefore BA = OA - OB = z_1 - z_2 = -(z_2 - z_1)$

Comments: · oK

iii) side CD is given by $z_3 - z_4$ or $-(z_4 - z_3)$

as CD ∥ AB, $(z_4 - z_3) = k(z_2 - z_1)$

Marking: ① side CD

but opposite sides of a parallelogram are equal,

so $|z_4 - z_3| = |z_2 - z_1| \Rightarrow k = \pm 1$

$k=1$: $\therefore z_4 - z_3 = z_2 - z_1$

or $z_1 - z_2 - z_3 + z_4 = 0$

Marking: ① deriving k

Comments: · not well done.

$k=-1$: $\therefore z_4 - z_3 = -(z_2 - z_1)$

but from (ii), AB (or BA) can be either $z_2 - z_1$ or $-(z_2 - z_1)$

$\therefore z_4 - z_3 = z_2 - z_1$

$\therefore z_1 - z_2 - z_3 + z_4 = 0$

Marking: ① both cases for k.

iv) the argument uses only real numbers, not complex numbers, thus

$-1 = (a+ib)^2$, where a, b are real.

$= a^2 - b^2 + 2abi$

$\therefore a^2 - b^2 = -1$ and $2ab = 0$

$b=0 \Rightarrow a^2 = -1$, which cannot happen as a is real

so $a=0$ and $-b^2=-1 \Rightarrow b = \pm 1$

$\therefore$ the roots are $-i$ and i

$i^2 = -1$ and $(-i)^2 = (-1)^2 i^2 = -1$

c) $\cos 2x = c = \sin 3x$ c constant

$\therefore\ \sin 3x = c$

or $\cos(\frac{\pi}{2} - 3x) = c$

$\frac{\pi}{2} - 3x = \cos^{-1}(c) + 2\pi n$ $n = 0, \pm1, \pm2 \ldots$

c) (cont) $\therefore\ -3x = -\frac{\pi}{2} + 2\pi n + \cos^{-1}(c)$

or $3x = \frac{\pi}{2} - 2\pi n - \cos^{-1}(c)$

but $\cos 2x = c$ also,

so $2x = \cos^{-1}(c)$

$\therefore\ 3x = \frac{\pi}{2} - 2\pi n - 2x$

$5x = \left(\frac{1-4n}{2}\right)\pi$

$\therefore\ x = \left(\frac{1-4n}{10}\right)\pi$

for $0 \le x \le \frac{\pi}{2}$, we get $x = \frac{\pi}{10}, \frac{\pi}{2}$ (using $n=0$, $n=-1$)

Marking: ① correct setup of problem (any method); ① correct solutions in range.

d) let $\tan^{-1} 3x = \theta$ and $\tan^{-1} 2x = \phi$

$\therefore\ \tan\theta = 3x \qquad \tan\phi = 2x$

for $\tan^{-1}\left(\frac{1}{5}\right) = \tan^{-1}(3x) - \tan^{-1}(2x)$

$= \theta - \phi$

taking tan of both sides:

$\tan\left(\tan^{-1}\frac{1}{5}\right) = \tan(\theta - \phi)$

$\therefore\ \frac{1}{5} = \frac{\tan\theta - \tan\phi}{1 + \tan\theta\tan\phi}$

$= \frac{3x - 2x}{1 + 3x.2x}$

$1 + 6x^2 = 5x$

or $0 = 6x^2 - 5x + 1$

$= 6x^2 - 3x - 2x + 1$

$= 3x(2x-1) - 1(2x-1)$

$= (2x-1)(3x-1)$

$\therefore\ x = \frac{1}{2}, \frac{1}{3}$

$\alpha\beta + \alpha\gamma + \beta\gamma = 2$

$\alpha\beta\gamma = 3$

i) $\alpha^2 + \beta^2 + \gamma^2 = (\alpha+\beta+\gamma)^2 - 2(\alpha\beta + \beta\gamma + \alpha\gamma)$

$= (-4)^2 - 2(2)$

$= 12$

Marking: ① answer

Comments: • some had an incorrect squares expansion!

ii) for roots $x = 1 - \alpha \Rightarrow \alpha = (1-x)$

$\therefore\ (1-x)$ in eqn gives:

$(1-x)^3 + 4(1-x)^2 + 2(1-x) - 3 = 0$

$1 - 3x + 3x^2 - x^3 + 4 - 8x + 4x^2 + 2 - 2x - 3 = 0$

$\therefore\ 4 - 13x + 7x^2 - x^3 = 0$

or $x^3 - 7x^2 + 13x - 4 = 0$

Marking: ① correct setup with roots; ① correct eqn.

Comments: • many simple algebraic errors

iii) for roots $x = \frac{1}{\alpha} \Rightarrow \alpha = \frac{1}{x}$

$\therefore\ \left(\frac{1}{x}\right)^3 + 4\left(\frac{1}{x}\right)^2 + 2\left(\frac{1}{x}\right) - 3 = 0$

$\times x^3$: $1 + 4x + 2x^2 - 3x^3 = 0$

or $3x^3 - 2x^2 - 4x - 1 = 0$

Marking: ① setup with roots; ① correct eqn

b) let α be the root of multiplicity 3,

then $P(\alpha) = P'(\alpha) = P''(\alpha) = 0$.

$\therefore\ P'(x) = 32x^3 - 75x^2 + 54x - 11$

$P''(x) = 96x^2 - 150x + 54$

if $P''(\alpha) = 0$, α is the soln to $0 = 96x^2 - 150x + 54$

or $0 = 48x^2 - 75x + 27$

$\therefore\ x = \frac{75 \pm \sqrt{2625 - 4.48.27}}{96}$

$= \frac{75 \pm \sqrt{441}}{96}$

$= \frac{75 \pm 21}{96}$

$= 1, \frac{9}{16}$

now, $P'(1) = 32 - 75 + 54 - 11$

$= 0$

and $P(1) = 8 - 25 + 27 - 11 + 1$

$= 0$

$\therefore\ (x-1)^3$ is a factor of $P(x)$

so $\alpha = 1$ is the tripple root.

Also, $\alpha^3.\beta = \frac{1}{8}$

$\therefore\ \beta = \frac{1}{8}$ is the other root.

Marking: ① set up problem with $P''(\alpha) = 0$; ① correct possibilities for tripple root; ① correct tripple root with reasons; ① other root

Comments: • several used $P'''(\alpha) = 0$ • many did not understand the implications for a root with multiplicity! • need to explicitly state the other root. $(8x-1)$ as a factor implies a root of $x = \frac{1}{8}$.
