

2010 Trial Examination

FORM VI

MATHEMATICS EXTENSION 1

Wednesday 11th August 2010

General Instructions

- Reading time — 5 minutes
- Writing time — 2 hours
- Write using black or blue pen.
- Board-approved calculators may be used.
- A list of standard integrals is provided at the end of the examination paper.
- All necessary working should be shown in every question.
- Start each question in a new booklet.

Structure of the paper

- Total marks — 84
- All seven questions may be attempted.
- All seven questions are of equal value.

Collection

- Write your candidate number clearly on each booklet.
- Hand in the seven questions in a single well-ordered pile.
- Hand in a booklet for each question, even if it has not been attempted.
- If you use a second booklet for a question, place it inside the first.
- Place the question paper inside your answer booklet for Question One.

Checklist

- SGS booklets — 7 per boy
- Candidature — 132 boys

Examiner

SJE

SGS Trial 2010 Form VI Mathematics Extension 1 Page 2

QUESTION ONE (12 marks) Use a separate writing booklet.

- (a) The polynomial $P(x) = x^4 - x^3 + kx - 4$ has a factor $(x+1)$. Find the value of k . 1
- (b) Differentiate $y = \sin(\log_e x)$. 1
- (c) Find, correct to the nearest degree, the acute angle between the lines
 $x - 3y + 4 = 0$ and $2x + y - 1 = 0$. 2
- (d) Find the coordinates of the point that divides the interval from $(-3, 4)$ to $(5, -2)$ in the ratio $1 : 3$. 2
- (e) Find the exact value of $\int_0^2 \frac{4}{4+x^2} dx$. 2
- (f) Find $\lim_{x \rightarrow 0} \left(\frac{\sin x \cos x}{x} \right)$. 1
- (g) Find the term independent of x in the expansion of $\left(x^2 + \frac{2}{x} \right)^{15}$. 3

QUESTION TWO (12 marks) Use a separate writing booklet.

- (a) The equation $x^3 + bx^2 + cx + d = 0$ has roots $2 + \sqrt{3}$, $2 - \sqrt{3}$ and -3 . Use the sum and the product of the roots to find b , c and d . 3
- (b) Consider the curve $f(x) = \sin^{-1}(2x)$.
 - (i) Sketch the curve. 2
 - (ii) Find the gradient of the tangent to the curve at the point where $x = \frac{1}{4}$. 2
- (c) A particle is undergoing simple harmonic motion subject to the equation $\frac{d^2x}{dt^2} = -6x$. Initially it is at rest at $x = 2$.
 - (i) In which direction will it start to move? 1
 - (ii) Show that $v^2 = 6(4 - x^2)$. 2
 - (iii) State the period and the amplitude of the motion. 2

Exam continues next page ...

QUESTION THREE (12 marks) Use a separate writing booklet.

Marks

- (a) Use the substitution $u = x - 1$ to find $\int x(x-1)^4 dx$. 2
- (b) (i) Express $\cos \theta - \sqrt{3} \sin \theta$ in the form $R \cos(\theta + \alpha)$, where $R > 0$ and $0 < \alpha < \frac{\pi}{2}$. 3
- (ii) Hence, or otherwise, solve $\cos \theta - \sqrt{3} \sin \theta = 1$, for $0 \leq \theta \leq 2\pi$. 2
- (c) Consider the function $f(x) = \frac{x-1}{x-2}$.
- (i) Show that $f^{-1}(x) = \frac{2x-1}{x-1}$. 1
- (ii) Find the vertical and horizontal asymptotes of $f^{-1}(x)$. 2
- (iii) Sketch $f^{-1}(x)$ showing the asymptotes and any x or y intercepts. 1
- (iv) Hence, or otherwise, solve $\frac{2x-1}{x-1} \geq 1$. 1

QUESTION FOUR (12 marks) Use a separate writing booklet.

Marks

- (a)
-
- A square pyramid has altitude PQ of length h and base $ABCD$ of side length x , as shown above. Each face makes an angle α with PQ and each edge makes an angle β with PQ . Assume that it is a right pyramid, so that Q lies in the centre of the base.

- (i) Show that $AQ = \frac{x}{\sqrt{2}}$. 1
- (ii) Hence express x in terms of h and β . 1
- (iii) Show that $\sqrt{2} \tan \alpha = \tan \beta$. 1

QUESTION FOUR (Continued)

- (b) Solve for x and y : 3

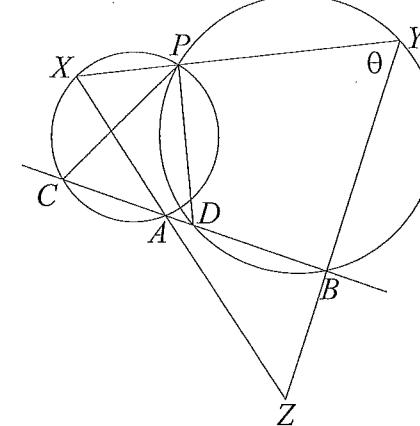

$$\log_3 x + \log_3 y = 6$$

$$\log_2 x - \log_2 y = 4$$

- (c) (i) Write $\cos^2 x$ in terms of $\cos 2x$. 1

(ii) Hence evaluate $\int_0^{\frac{\pi}{3}} \sin 2x \cos^2 x dx$. 2

- (d)

In the diagram above, two circles intersect and P is one of the points of intersection. A straight line is drawn through P cutting the two circles at X and Y . An isosceles triangle XYZ is constructed with $XZ = YZ$. Suppose that XZ cuts the smaller circle at A and YZ cuts the larger circle at B . Suppose also that the line AB cuts the circles at C and D . Let $\angle XYZ$ be θ .

Prove that $\triangle CPD$ is isosceles.

NOTE: You do not have to copy the diagram above. It has been reproduced for you on a tear-off sheet at the end of this paper. Insert this sheet into your answer booklet.

QUESTION FIVE (12 marks) Use a separate writing booklet.

Marks

- (a) Consider the two points $P(4t, 2t^2)$ and $Q(8t, 8t^2)$ on the parabola $x^2 = 8y$. The tangents at P and Q intersect at R .

(i) Find the equations of the tangents at P and Q .

[2]

(ii) Find the coordinates of R .

[2]

(iii) Hence find the locus of R .

[1]

- (b) By substituting a suitable value for x in the expansion of $(1+x)^n$, show that

[2]

$$1 + 2 \binom{n}{1} + 4 \binom{n}{2} + \dots + 2^{n-1} \binom{n}{n-1} = 3^n - 2^n.$$

- (c) A forensic scientist is called upon to determine the time of death of a corpse found in a room which is maintained at a constant temperature of 20°C . The temperature T of the corpse was initially measured at midnight to be 29°C . The scientist measured the temperature of the corpse one hour later and it had fallen to 26°C . Assume that the temperature of the body at the time of death was 36.8°C and that the rate of temperature decrease obeys Newton's law of cooling. Let t be the number of hours after midnight.

(i) Show that $T = 20 + 9e^{-kt}$ satisfies the cooling equation $\frac{dT}{dt} = -k(T - 20)$.

[1]

(ii) Show that $k = \ln \frac{3}{2}$.

[2]

(iii) Hence estimate the time of death, to the nearest minute.

[2]

QUESTION SIX (12 marks) Use a separate writing booklet.

Marks

- (a) Prove by mathematical induction that for all positive integer values of n ,

[3]

$$\frac{1}{2!} + \frac{2}{3!} + \frac{3}{4!} + \dots + \frac{n}{(n+1)!} = 1 - \frac{1}{(n+1)!}.$$

- (b) A film director must decide whether a stuntman is able to perform a dangerous stunt. The stuntman must leap from a building onto the centre of some erected scaffolding. The centre of the scaffolding is 5 m below his initial position and at a horizontal distance of 14 m . The stuntman jumps at an angle of 30° above the horizontal. Let the stuntman's initial velocity be V , and let x and y be his horizontal and vertical displacements respectively from his initial position. You may assume that the velocity and displacement equations are:

$$\dot{x} = V \cos 30^\circ \quad \dot{y} = -10t + V \sin 30^\circ$$

$$x = Vt \cos 30^\circ \quad y = -5t^2 + Vt \sin 30^\circ$$

- (i) Show that the Cartesian equation of the stuntman's path is

[2]

$$y = -\frac{20x^2}{3V^2} + \frac{x}{\sqrt{3}}.$$

- (ii) Hence determine the required initial velocity V so that he lands in the centre of the scaffolding. Write your answer to the nearest m/s.

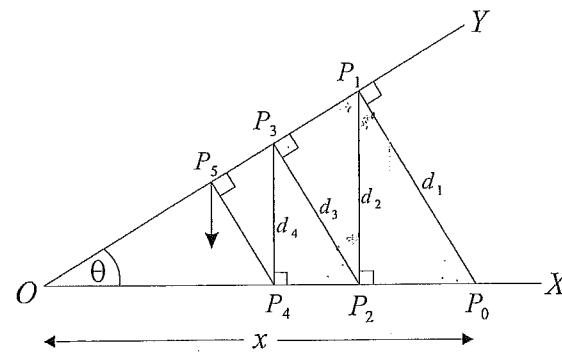

[2]

- (iii) Safety requirements are such that if the impact velocity is greater than 15 m/s , then padding must be placed on the scaffolding. Assuming that the stuntman leaps at the required speed, determine whether or not padding is needed.

[2]

QUESTION SIX (Continued)

(c)

The diagram above shows two straight lines OX and OY . The points P_0, P_2, P_4, \dots lie on OX , while the points P_1, P_3, P_5, \dots lie on OY .

P_1 is the foot of the perpendicular from P_0 to OY ,
 P_2 is the foot of the perpendicular from P_1 to OX ,
 P_3 is the foot of the perpendicular from P_2 to OY , and so on.

Let $\angle X O Y = \theta$, where $0^\circ < \theta < 90^\circ$, let $OP_0 = x$, and let the length of the line joining P_{r-1} to P_r be denoted by d_r , for $r = 1, 2, 3, \dots$

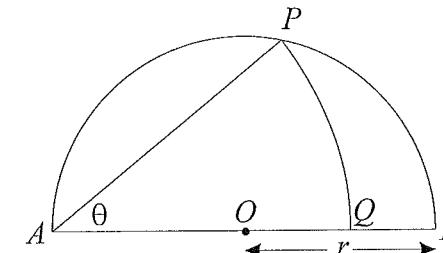

(i) Show that the lengths d_1, d_2, d_3, \dots form a geometric series. 2

(ii) Hence prove that $\sum_{r=1}^{\infty} d_r = x \cot \frac{\theta}{2}$. 1

QUESTION SEVEN (12 marks) Use a separate writing booklet.

Marks

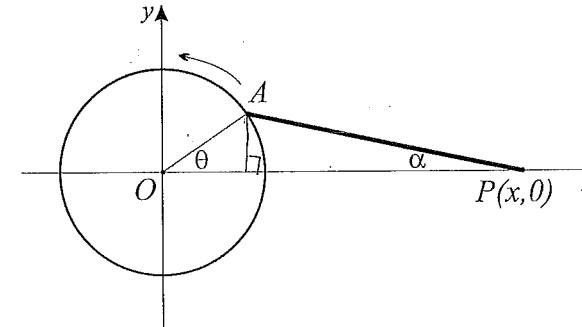

(a)

The diagram above shows a semi-circle with centre O , radius r and diameter AB . Let P be a point on arc AB . The arc PQ has centre A and Q lies on AB . Let $\angle PAQ = \theta$.

- (i) Show that $AP = 2r \cos \theta$. 1
- (ii) Prove that as θ varies, the arc PQ will have maximum length when $\theta \sin \theta = \cos \theta$. 3
- (iii) Taking $\theta = 1$ as a first approximation to the value of θ that maximises the arc PQ , use one application of Newton's method to find a better approximation. Round your answer to two decimal places. 2

(b)

The diagram above shows a rotating wheel with radius 40 cm and a connecting rod AP with length 120 cm. The pin P slides back and forth along the x -axis as the wheel rotates anticlockwise at a rate of 6 revolutions per second. In each part below you need only address the case where A is in the first quadrant.

(i) Show that $\alpha = \sin^{-1} \left(\frac{\sin \theta}{3} \right)$. 1

(ii) Use the chain rule to show that $\frac{d\alpha}{dt} = \frac{12\pi \cos \theta}{\sqrt{9 - \sin^2 \theta}}$ radians per second. 1

(iii) Show that $x = 40 \left(\cos \theta + \sqrt{9 - \sin^2 \theta} \right)$. 2

(iv) Find an expression for the velocity of the pin P in terms of θ . 2

Question 1

$$(a) P(1) = (-1)^4 - (-1)^3 + kx - 4 = 0$$

$$\therefore 1 + 1 - k - 4 = 0$$

$$-k - 2 = 0$$

$$k = -2 \quad \checkmark \textcircled{1}$$

$$(b) y = \sin(\log_e x)$$

$$\frac{dy}{dx} = \frac{\cos(\log_e x)}{x} \quad \checkmark \textcircled{1}$$

$$(c) \tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

$$= \left| \frac{\frac{1}{3} - -2}{1 + \frac{1}{3}(-2)} \right|$$

$$= \left| \frac{\frac{7}{3}}{-\frac{5}{3}} \right|$$

$$= 7$$

$$\therefore \theta \doteq 82^\circ \text{ (nearest degree)} \quad \checkmark \textcircled{2}$$

$$(d) x = \frac{1(5) + 3(-3)}{1+3} \quad y = \frac{1(-2) + 3(4)}{1+3} \quad \checkmark$$

$$= -1 \quad = \frac{5}{2}$$

$$\therefore \text{Coordinates are } (-1, \frac{5}{2}) \quad \checkmark \textcircled{2}$$

$$(e) \int_0^2 \frac{4}{4+x^2} dx = 4 \left[\frac{1}{2} \tan^{-1}\left(\frac{x}{2}\right) \right]_0^2$$

$$= 2 \left[\tan^{-1}(1) - \tan^{-1}0 \right]$$

$$= 2 \cdot \frac{\pi}{4}$$

$$= \frac{\pi}{2} \quad \checkmark \textcircled{2}$$

$$(f) \lim_{x \rightarrow 0} \left(\frac{\sin x \cos x}{x} \right) = \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right) \times \lim_{x \rightarrow 0} (\cos x)$$

$$= 1 \times 1 \quad \checkmark \textcircled{1}$$

$$(g) \left(x^2 + \frac{2}{x} \right)^{15}$$

General Term: ${}^{15}C_r (x^2)^{15-r} \left(\frac{2}{x} \right)^r \quad \checkmark$

$$= {}^{15}C_r x^{2r} x^{-15+r} 2^{15-r}$$

$$= {}^{15}C_r x^{3r-15} 2^{15-r}$$

So, Term independent of x has

$$3r - 15 = 0$$

$$r = 5$$

$$\therefore \text{Term is } {}^{15}C_5 2^{10} = 3075072 \quad \checkmark \textcircled{1}$$

Question 2

(a) Sum of roots: $2+\sqrt{3} + 2-\sqrt{3} - 3 = -\frac{b}{1}$

$$\begin{aligned} 1 &= -b \\ b &= -1 \quad \checkmark \end{aligned}$$

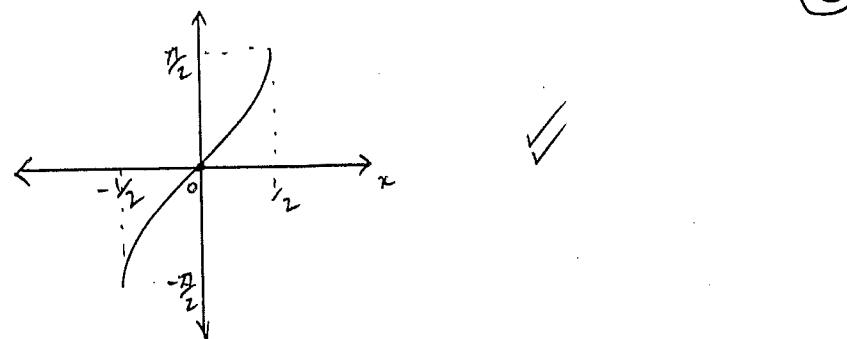

Product of roots: $(2+\sqrt{3})(2-\sqrt{3})(-3) = -d$

$$\begin{aligned} (4-3)(-3) &= -d \\ d &= 3 \quad \checkmark \end{aligned}$$

Also, $(2+\sqrt{3})(2-\sqrt{3}) + (2-\sqrt{3})(-3) + (-3)(2+\sqrt{3}) = c$

$$\begin{aligned} 4-3 &+ -6 + 3\sqrt{3} - 6 - 3\sqrt{3} = c \\ -11 &= c \quad \checkmark \end{aligned}$$

(b) (i)

(ii) $f'(x) = \frac{2}{\sqrt{1-(2x)^2}}$ \checkmark

$$\begin{aligned} f'\left(\frac{1}{4}\right) &= \frac{2}{\sqrt{1-\frac{1}{4}}} \\ &= \frac{2}{\frac{\sqrt{3}}{2}} \end{aligned}$$

$$= \frac{4}{\sqrt{3}} \quad \checkmark$$

(4)

(c) $\frac{d^2x}{dt^2} = -6x$

$$\begin{aligned} t &= 0 \\ x &= 2 \\ v &= 0 \end{aligned}$$

(i) Negative direction towards the origin

(ii) $\frac{d}{dx}\left(\frac{1}{2}v^2\right) = -6x$

$$\frac{1}{2}v^2 = -3x^2 + c_1$$

$$v^2 = -6x^2 + c_2$$

Now $v=0, x=2$

$$0 = -24 + c_2$$

$$\therefore c_2 = 24$$

So $v^2 = -6x^2 + 24$

$$= 6(1-x^2) \quad \text{as required}$$

(iii) $\frac{d^2x}{dt^2} = -n^2x$

$$\therefore n^2 = 6$$

$$n = \sqrt{6}$$

$$\begin{aligned} \text{Period} &= \frac{2\pi}{n} \\ &= \frac{2\pi}{\sqrt{6}} \\ &= \frac{\pi\sqrt{6}}{3} \end{aligned}$$

Amplitude = 2

(5)

Question 3

$$\begin{aligned}
 (a) & \int x(x-1)^4 dx \\
 &= \int (u+1) u^4 du \quad \checkmark \\
 &= \int u^5 du + \int u^4 du \\
 &= \frac{u^6}{6} + \frac{u^5}{5} + C \\
 &= \frac{(x-1)^6}{6} + \frac{(x-1)^5}{5} + C \quad \checkmark \quad (2)
 \end{aligned}$$

$$\begin{aligned}
 (b) (i) \cos \theta - \sqrt{3} \sin \theta &= R \cos(\theta + \alpha) \\
 &= R [\cos \theta \cos \alpha - \sin \theta \sin \alpha] \quad \checkmark
 \end{aligned}$$

Equating coefficients:

$$\begin{aligned}
 R \cos \alpha &= 1 \\
 R \sin \alpha &= \sqrt{3}
 \end{aligned}$$

$$\begin{aligned}
 \text{Squaring and adding} \quad R^2 &= 4 \\
 \therefore R &= 2 \quad \checkmark
 \end{aligned}$$

$$\begin{aligned}
 \cos \alpha &= \frac{1}{2} \quad (\alpha \text{ acute}) \\
 \therefore \alpha &= \frac{\pi}{3} \quad \checkmark
 \end{aligned}$$

$$\text{So } \cos \theta - \sqrt{3} \sin \theta = 2 \cos(\theta + \frac{\pi}{3})$$

$$\begin{aligned}
 (ii) \quad 2 \cos(\theta + \frac{\pi}{3}) &= 1 \quad \frac{\pi}{3} \leq \theta + \frac{\pi}{3} \leq \frac{7\pi}{3} \\
 \cos(\theta + \frac{\pi}{3}) &= \frac{1}{2} \quad \checkmark
 \end{aligned}$$

$$\theta + \frac{\pi}{3} = \frac{\pi}{3}, \frac{5\pi}{3}, \frac{7\pi}{3}$$

$$\therefore \theta = 0, \frac{4\pi}{3}, 2\pi \quad \checkmark \quad (5)$$

$$(c) (i) f(x) = y = \frac{x-1}{x-2}$$

Interchange x and y

$$x = \frac{y-1}{y-2}$$

$$x(y-2) = y-1$$

$$xy - y = -1 + 2x$$

$$y(x-1) = 2x-1$$

$$y = \frac{2x-1}{x-1}$$

$$\therefore f^{-1}(x) = \frac{2x-1}{x-1} \text{ as required.}$$

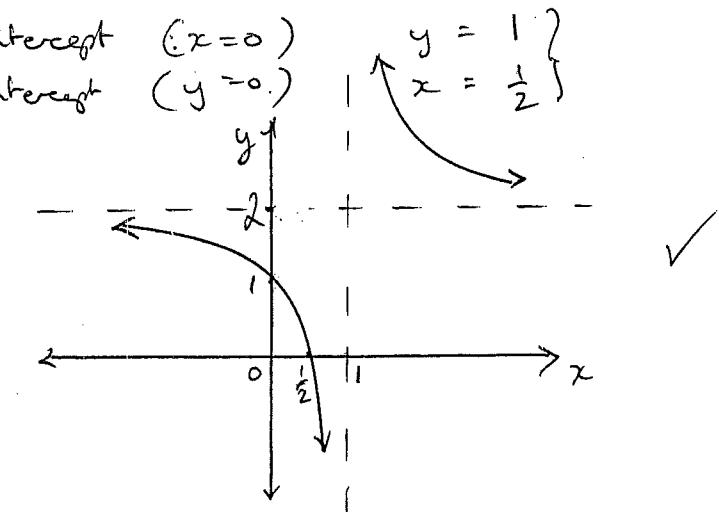

(ii) Vertical asymptote: $x = 1$

$$f^{-1}(x) = \frac{2 - \frac{1}{x}}{1 - \frac{1}{x}}$$

as $x \rightarrow \pm \infty$ $f^{-1}(x) \rightarrow 2$

∴ Horizontal asymptote: $y = 2$

(iii) y -intercept ($x=0$) $y = 1$
 x -intercept ($y=0$) $x = \frac{1}{2}$

$$\frac{2x-1}{x-1} \geq 1 \quad \text{when } x \leq 0 \text{ or } x > 1$$

(5)

Question 4

$$(a) (i) AC^2 = x^2 + x^2 \\ = 2x^2$$

$$AC = \sqrt{2}x$$

$$AQ = \frac{\sqrt{2}x}{2}$$

$$= \frac{x}{\sqrt{2}} \text{ as required}$$

$$(ii) \tan \beta = \frac{AQ}{h}$$

$$= \frac{2c}{\sqrt{2}h}$$

$$\therefore xc = \sqrt{2}h \tan \beta \quad \checkmark$$

$$(iii) \tan \alpha = \frac{x}{\frac{x}{2}}$$

$$\therefore 2\tan \alpha = \frac{x}{h} \quad \text{and} \quad \sqrt{2} \tan \beta = \frac{2c}{h}$$

$$\therefore 2\tan \alpha = \sqrt{2} \tan \beta$$

$$\sqrt{2} \tan \alpha = \tan \beta$$

(3)

(b)

$$\begin{aligned} \log_3 x + \log_3 y &= 6 \\ \log_2 x - \log_2 y &= 4 \end{aligned}$$

$$\begin{aligned} xy &= 3^6 \\ \frac{x}{y} &= 2^4 \end{aligned}$$

Solving simultaneously

$$x^2 = 11684$$

$$x = 108 \quad (x > 0) \quad \checkmark$$

$$\begin{aligned} y &= \frac{3^6}{108} \\ &= 6^{3/4} \end{aligned}$$

(3)

$$(c) (i) \cos^2 x = \frac{1}{2} \cos 2x + \frac{1}{2} \quad \checkmark$$

$$\begin{aligned} (ii) \int_0^{\pi/3} \sin 2x \cos^2 x dx &= \frac{1}{2} \int_0^{\pi/3} (\sin 2x \cos 2x + \sin 2x) dx \\ &= \frac{1}{2} \left[\frac{\sin^2 2x}{4} \right]_0^{\pi/3} + \frac{1}{2} \left[-\frac{\cos 2x}{2} \right]_0^{\pi/3} \\ &= \frac{1}{8} \left[\left(\frac{\sqrt{3}}{2}\right)^2 - 0 \right] + \frac{1}{4} \left[-\frac{1}{2} - -1 \right] \\ &= -\frac{3}{32} + \frac{3}{8} \\ &= \frac{15}{32} \end{aligned}$$

(3)

(c) Alternate Solution

$$\begin{aligned} \int_0^{\pi/3} \sin 2x \cos^2 x dx &= \frac{1}{2} \int_0^{\pi/3} \sin 2x (1 + \cos 2x) dx \\ &= \frac{1}{2} \int_0^{\pi/3} \sin 2x dx + \frac{1}{2} \int_0^{\pi/3} \sin 2x \cos 2x dx \\ &= -\frac{1}{4} [\cos 2x]_0^{\pi/3} + \frac{1}{4} \int_0^{\pi/3} \sin 4x dx \\ &= \left[-\frac{\cos 2x}{4} \right]_0^{\pi/3} + \left[-\frac{\cos 4x}{16} \right]_0^{\pi/3} \\ &= \frac{1}{8} + \frac{1}{4} + \frac{1}{32} + \frac{1}{16} \\ &= \frac{15}{32} \end{aligned}$$

(c) Alternate Solution.

$$\begin{aligned} \int_0^{\pi/3} \sin 2x \cos^2 x \, dx &= 2 \int_0^{\pi/3} \cos^3 x \sin x \, dx \\ &= -2 \left[\frac{\cos^4 x}{4} \right]_0^{\pi/3} \\ &= -2 \left(\frac{1}{64} - \frac{1}{4} \right) = \frac{15}{32} \end{aligned}$$

Question 5

(a) $x^2 = 8y \quad \therefore a = 2$

(i) gradient of tangent at $P(4t, 2t^2)$ is t
equation of tangent at P : $y - 2t^2 = t(x - 4t)$
 $y = tx - 2t^2 \quad \checkmark$

gradient of tangent at $Q(8t, 8t^2) = 2t$

equation of tangent at Q : $y - 8t^2 = 2t(x - 8t)$
 $y = 2tx - 8t^2 \quad \checkmark$

(d)

$\angle YXZ = \theta$ (base angles of isosceles triangle XYZ)

$\angle PXA = \angle PCA$ (angles subtended at the circumference by arc PA) \checkmark

$$= \theta$$

$\angle PDC = \theta$ (exterior angle of a cyclic quadrilateral $PYBD$) \checkmark

$$\therefore \angle PCD = \angle PDC = \theta$$

$\therefore \triangle CPD$ is isosceles

③

(ii) Solving the equation of the tangents simultaneously

$$tx - 2t^2 = 2tx - 8t^2$$

$$6t^2 = tx$$

$$x = 6t \quad \checkmark$$

$$\begin{aligned} y &= t(6t) - 2t^2 \\ &= 4t^2 \end{aligned}$$

\therefore Coordinates of R are $(6t, 4t^2)$

(iii) Locus of R : $t = \frac{x}{6}$

$$y = 4\left(\frac{x}{6}\right)^2$$

$$= \frac{4x^2}{36}$$

$$\therefore x^2 = 9y \quad \checkmark$$

⑤

12

$$b) (1+x)^n = \binom{n}{0} + \binom{n}{1}x + \binom{n}{2}x^2 + \dots + \binom{n}{n}x^n$$

Substitute $x=2$

$$3^n = 1 + \binom{n}{1}2 + \binom{n}{2}4 + \dots + \binom{n}{n-1}2^{n-1} + \binom{n}{n}2^n$$

$$\text{Now } \binom{n}{n} = 1$$

$$\therefore 3^n = 1 + 2\binom{n}{1} + 4\binom{n}{2} + \dots + 2^{n-1}\binom{n}{n-1} + 2^n$$

$$3^n - 2^n = 1 + 2\binom{n}{1} + 4\binom{n}{2} + \dots + 2^{n-1}\binom{n}{n-1}$$

as required 2

(c) At midnight: $t=0$, $T=29^\circ C$

$$t=1, T=26^\circ C$$

$$\text{i) } T = 20 + 9e^{-kt} \Rightarrow T-20 = 9e^{-kt}$$

$$\begin{aligned} \frac{dT}{dt} &= -k \cdot 9e^{-kt} \\ &= -k(T-20) \quad \text{as required.} \end{aligned}$$

$$\text{ii) } T = 20 + 9e^{-kt}$$

$$t=1, T=26$$

$$26 = 20 + 9e^{-k}$$

$$6 = 9e^{-k}$$

$$\frac{2}{3} = e^{-k}$$

$$\ln\left(\frac{2}{3}\right) = -k$$

$$\therefore k = \ln\left(\frac{3}{2}\right)$$

Question 5. (cont.)

(c) (iii) For time of death solve for t when $T=36.8$.

$$36.8 = 20 + 9e^{-kt} \quad (k = \ln\frac{3}{2})$$

$$\frac{16.8}{9} = e^{-kt}$$

$$\ln\left(\frac{16.8}{9}\right) = -kt$$

$$t = -\frac{\ln\left(\frac{16.8}{9}\right)}{\ln\left(\frac{3}{2}\right)}$$

$$\therefore -1.54 \text{ hours}$$

$$\therefore -1 \text{ hour } 32 \text{ mins.}$$

\therefore Time of death is approximately 10:28 p.m
(1 hour 32 minutes before midnight)

5

12

Question 6

a) Step 1 : $n = 1$

$$\begin{aligned} \text{LHS} &= \frac{1}{2!} \\ &= \frac{1}{2} \end{aligned}$$

$$\begin{aligned} \text{RHS} &= 1 - \frac{1}{2} \\ &= \frac{1}{2} \\ &= \text{LHS} \end{aligned}$$

Hence, the result is true for $n = 1$.

Step 2 : Suppose the result is true for $n = k$.

$$\text{i.e. } \frac{1}{2!} + \frac{2}{3!} + \frac{3}{4!} + \dots + \frac{k}{(k+1)!} = 1 - \frac{1}{(k+1)!} \quad (*)$$

We need to show that the result is true for $n = k+1$

$$\text{i.e. } \frac{1}{2!} + \frac{2}{3!} + \frac{3}{4!} + \dots + \frac{k}{(k+1)!} + \frac{k+1}{(k+2)!} = 1 - \frac{1}{(k+2)!}$$

$$\text{LHS} = 1 - \frac{1}{(k+1)!} + \frac{k+1}{(k+2)!} \quad \text{by } (*)$$

$$= 1 - \frac{(k+2) - (k+1)}{(k+2)!}$$

$$= 1 - \frac{k+2 - k-1}{(k+2)!}$$

$$= 1 - \frac{1}{(k+2)!}$$

$$= \text{RHS}$$

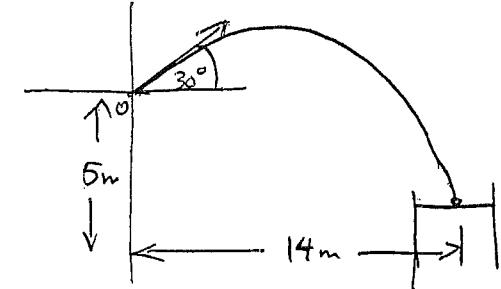

Step 3 It follows from Step 1 and Step 2 by mathematical induction that it is true for all positive integers

Question 6 (cont.)

b) i)

$$\begin{aligned} x &= Vt \cos 30^\circ \\ &= \frac{\sqrt{3}}{2} V t \end{aligned}$$

$$\therefore t = \frac{2x}{\sqrt{3}V}$$

$$\text{So } y = -5 \left(\frac{2x}{\sqrt{3}V} \right)^2 + \frac{\sqrt{3}x}{\sqrt{3}V} \cdot \frac{1}{2} \quad \checkmark$$

$$= -\frac{20x^2}{3V^2} + \frac{x}{\sqrt{3}} \quad \text{as required.}$$

(ii) Sub. $x = 14$, $y = -5$ and solve for V .

$$-5 = -\frac{20(14)^2}{3V^2} + \frac{14}{\sqrt{3}}$$

$$-15V^2 = -20 \times 196 + 14\sqrt{3}V^2$$

$$V^2(14\sqrt{3} + 15) = 20 \times 196$$

$$V^2 = \frac{3920}{14\sqrt{3} + 15}$$

$$\therefore V = 99.87589\dots$$

$$\therefore V = 10 \text{ m/s}$$

3

$$\text{ii) Impact Velocity} = \sqrt{\dot{x}^2 + \dot{y}^2}$$

First, calculate time of flight, $x=14, v=10$

$$t = \frac{2(14)}{\sqrt{3}(10)}$$

$$= \frac{14}{5\sqrt{3}} \quad \checkmark$$

$$\dot{x} = \frac{10\sqrt{3}}{2}$$

$$= 5\sqrt{3}$$

$$\dot{y} = -10 \frac{14}{5\sqrt{3}} + 10 \cdot \frac{1}{2}$$

$$= -\frac{28}{\sqrt{3}} + 5$$

$$= \frac{-28\sqrt{3} + 15}{3}$$

$$v = \sqrt{(5\sqrt{3})^2 + \left(\frac{15-28\sqrt{3}}{3}\right)^2}$$

$$= \sqrt{199.99\dots}$$

$$\therefore 14.14 \text{ m/s} \quad \checkmark$$

Padding is not required

Question 6 (cont.)

$$(c) \text{i) } \angle O P_0 P_1 = 90 - \theta \text{ (angle sum of } \triangle O P_0 P_1)$$

$$\angle P_2 P_1 P_0 = \theta \text{ (angle sum of } \triangle P_2 P_1 P_0)$$

$$\text{Now } \cos \theta = \frac{d_2}{d_1}$$

$$\text{Similarly } \angle P_3 P_2 P_1 = \theta$$

$$\text{and } \cos \theta = \frac{d_3}{d_2}$$

Geometric series : as $\frac{d_3}{d_2} = \frac{d_2}{d_1} = \cos \theta$

$$a = d_1 = x \sin \theta \quad (\text{from } \triangle P_1 O P_0) \quad \checkmark$$

$$r = \cos \theta$$

(6)

$$\begin{aligned} \text{(ii)} \quad \sum_{r=1}^{\infty} dr &= \frac{x \sin \theta}{1 - \cos \theta} \quad \text{since } |\cos \theta| < 1 \\ &= x \frac{2 \sin \theta/2 \cos \theta/2}{2 \sin^2 \theta/2} \\ &= x \frac{\cos \theta/2}{\sin \theta/2} \\ &= x \cot \theta/2 \quad \text{as required} \end{aligned}$$

(3)

Question 7

a) (i) Join PB $\therefore \angle APB = 90^\circ$ (angle in a semi-circle)

$$\text{So } \frac{AP}{2r} = \cos \theta$$

$$AP = 2r \cos \theta$$

(ii) Let l be arc length PQ

$$l = AP \times \theta \\ = 2r \cos \theta \times \theta \quad (\theta \text{ in radians})$$

$$\frac{dl}{d\theta} = 2r \cos \theta + 2r \theta (-\sin \theta) \\ = 2r (\cos \theta - \theta \sin \theta)$$

Stationary point when $\cos \theta - \theta \sin \theta = 0$
 $\theta \sin \theta = \cos \theta$

Now $\frac{d^2l}{d\theta^2} < 0$ for a maximum

$$\frac{d^2l}{d\theta^2} = 2r(-\sin \theta) - 2r[\sin \theta + \theta \cos \theta] \\ = 2r(-2 \sin \theta - \cos \theta) \\ = -2r(2 \sin \theta + \theta \cos \theta) < 0$$

since $0 < \theta < \frac{\pi}{2}$ (θ in a semi-circle)

(iii) let $f(\theta) = \theta \sin \theta - \cos \theta$

$$f'(\theta) = \theta \cos \theta + 2 \sin \theta$$

$$\theta_0 = 1$$

Question 7 (cont.)

$$(a) (iii) \text{ cont. } \theta_1 = 1 - \frac{f(\theta_0)}{f'(\theta_0)}$$

$$= 1 - \frac{1 \times \sin 1 - \cos 1}{1 \times \cos 1 + 2 \sin 1}$$

$$= \frac{\cos 1 + 2 \sin 1 - \sin 1 + \cos 1}{\cos 1 + 2 \sin 1}$$

$$= \frac{2 \cos 1 + \sin 1}{\cos 1 + 2 \sin 1}$$

$$\approx 0.86 \quad (2 \text{ dec. pl.})$$

(6)

(b) (ii) Using sine rule :

$$\frac{\sin \alpha}{40} = \frac{\sin \theta}{120}$$

$$\sin \alpha = \frac{\sin \theta}{3}$$

$$\alpha = \sin^{-1} \left(\frac{\sin \theta}{3} \right) \text{ as required}$$

$$0 < \alpha < \frac{\pi}{2}$$

$$(iii) \quad \frac{d\alpha}{dt} = \frac{d\alpha}{d\theta} \cdot \frac{d\theta}{dt}$$

$$\text{Now } \frac{d\theta}{dt} = 6 \text{ revs/s}$$

$$= 12\pi \text{ radians/sec}$$

$$\frac{d\alpha}{d\theta} = \frac{1}{3} \cos \theta \cdot \frac{1}{\sqrt{1 - \frac{\sin^2 \theta}{9}}}$$

$$\frac{dx}{d\theta} = \frac{1}{3} \cos \theta \cdot \frac{3}{\sqrt{9 - \sin^2 \theta}}$$

$$= \frac{\cos \theta}{\sqrt{9 - \sin^2 \theta}}$$

✓

$$\text{So } \frac{dx}{dt} = \frac{\cos \theta}{\sqrt{9 - \sin^2 \theta}} \cdot 12\pi$$

$$= \frac{12\pi \cos \theta}{\sqrt{9 - \sin^2 \theta}} \quad \text{as required}$$

(iii) Drop a perpendicular AX from A intersecting OP at X

$$x = OX + XP$$

$$\text{Now } OX = 40 \cos \theta$$

$$XP = 120 \cos \alpha$$

✓

$$\begin{aligned} \therefore x &= 40 \cos \theta + 120 \sqrt{1 - \sin^2 \alpha} \\ &= 40 \cos \theta + 120 \sqrt{1 - \frac{\sin^2 \theta}{9}} \quad \text{from (i)} \\ &= 40 \left(\cos \theta + 3 \frac{\sqrt{9 - \sin^2 \theta}}{3} \right) \\ &= 40 \left(\cos \theta + \sqrt{9 - \sin^2 \theta} \right) \end{aligned}$$

Alternate solution to (iii) using cosine rule

$$\cos \theta = \frac{40^2 + x^2 - 120^2}{2(40)x}$$

$$x^2 - 80x \cos \theta + (40^2 - 120^2) = 0$$

Using the quadratic formula

$$x = \frac{80 \cos \theta \pm \sqrt{80^2 \cos^2 \theta - 4(40^2 - 120^2)}}{2}$$

$$= 40 \cos \theta \pm 40 \sqrt{\cos^2 \theta + 8}$$

$$= 40 (\cos \theta + \sqrt{\cos^2 \theta + 8}), x > 0$$

$$= 40 (\cos \theta + \sqrt{9 - \sin^2 \theta}) \quad \text{as required.}$$

(iv)

$$\frac{dx}{dt} = \frac{dx}{d\theta} \cdot \frac{d\theta}{dt}$$

✓

$$= 40 \left(-\sin \theta + \frac{1}{2} \frac{1}{\sqrt{9 - \sin^2 \theta}} \cdot -2 \sin \theta \cos \theta \right)$$

$\times 12\pi$

$$= 480\pi \left[-\sin \theta - \frac{\cos \theta \sin \theta}{\sqrt{9 - \sin^2 \theta}} \right]$$
