

Mini Test 30: Change and Data

1 The average (mean) of 7 numbers is 29. One number is left out and the average increases to 32. What number is left out?
A 11 B 21 C 29 D 32

2 Lindsay recorded the colours of cars that went past her house. The results are shown in the table.

Colour	Number
Red	16
White	32
Blue	21
Silver	12
Other	15

Based on these results, what is the probability that a car is silver?
A $\frac{1}{5}$ B $\frac{1}{6}$ C $\frac{1}{7}$ D $\frac{1}{8}$

3 Each week, Liam's class do a test marked out of 100. Liam's average for the first six tests is 78. What must he score in the seventh test to increase his average to 80?

4 The eye colour of 200 students was recorded and the results were shown in a sector graph.

What is the best approximation for the number of students whose eyes are brown?

A 50 B 65 C 80 D 95

5 Corey spins this spinner 60 times.

Which table is most likely to show the results?

A

Number spun	Number of spins
1	20
2	20
3	20

B

Number spun	Number of spins
1	20
2	15
3	25

C

Number spun	Number of spins
1	25
2	20
3	15

D

Number spun	Number of spins
1	30
2	20
3	10

6 The average (mean) age of 11 cricket players was 32. The 12th man was 20 years old. What was the average age of the 12 players?
A 26 B 29 C 31 D 32

7 **Temperature at Toptown**

Over which of the time periods below did the temperature change the most?
A noon to midnight B 3 pm to 3 am
C 6 pm to 6 am D 9 pm to 9 am

8 A man has been early or on time for work on 15 days and late on 30 days. Based on this information, what is the probability that he will be late?
A $\frac{1}{2}$ B $\frac{1}{3}$ C $\frac{2}{3}$ D $\frac{2}{5}$

9 A few entries in this table are missing.

	Driver	Passenger	Total
Men	79		106
Women			
Total		127	

How many women were passengers?

10 The average (mean) age of male workers at a factory was 25 and the average age of female workers was 35. If there were 30 male and 20 female workers at the factory, what is the average age?
A 29 B 30 C 31 D 32

11 Saskia has \$100 in New Zealand dollars.

How much is this in US dollars? US\$

1 A 2 D 3 92 4 C 5 D 6 C 7 D 8 C 9 100
10 A 11 US\$60

1 The average of 7 numbers is 29.

$$\begin{aligned} \text{Sum of the numbers} &= 29 \times 7 \\ &= 203 \end{aligned}$$

The average of 6 numbers is 32.

$$\begin{aligned} \text{Sum of those numbers} &= 32 \times 6 \\ &= 192 \end{aligned}$$

$$\begin{aligned} \text{Difference} &= 203 - 192 \\ &= 11 \end{aligned}$$

The number left out must have been 11.

2 Total number of cars

$$\begin{aligned} &= 16 + 32 + 21 + 12 + 15 \\ &= 96 \end{aligned}$$

$$\begin{aligned} \text{Probability of silver} &= \frac{12}{96} \\ &= \frac{1}{8} \end{aligned}$$

Colour	Number
Red	16
White	32
Blue	21
Silver	12
Other	15

3 Total of first 6 marks = 6×78
= 468

To have an average of 80 after 7 tests:

$$\begin{aligned} \text{New total} &= 7 \times 80 \\ &= 560 \end{aligned}$$

$$\begin{aligned} \text{Difference} &= 560 - 468 \\ &= 92 \end{aligned}$$

Liam would need to score 92 in his seventh test.

4 The sector graph is divided into 12 equal parts.

5 of those parts represent students with eyes that are brown.

Number of students with eyes that are brown

$$= \frac{5}{12} \times 200$$

$$= 83.333\dots$$

Of the choices the best approximation is 80.

5 The spinner shows 1 three times, 2 twice and 3 once.

So in 6 spins you would expect to get 1 three times, 2 twice and 3 once.

In 60 spins you would expect to get 1 thirty times, 2 twenty times and 3 ten times.

The table in Option D is the most likely result.

6 Total of the ages of 11 players

$$\begin{aligned} &= 11 \times 32 \\ &= 352 \end{aligned}$$

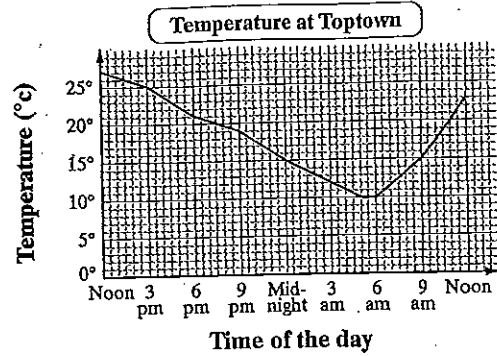

Total of the ages of 12 players

$$\begin{aligned} &= 352 + 20 \\ &= 372 \end{aligned}$$

Average age of the 12 players

$$\begin{aligned} &= 372 \div 12 \\ &= 31 \end{aligned}$$

7 Consider each option.

Between noon and midnight:

At noon the temperature was 27°.

At midnight it was 15°.

$$\begin{aligned} \text{Difference} &= 27^\circ - 15^\circ \\ &= 12^\circ \end{aligned}$$

Between 3 pm and 3 am:

At 3 pm the temperature was 25°.

At 3 am it was 12°.

$$\begin{aligned} \text{Difference} &= 25^\circ - 12^\circ \\ &= 13^\circ \end{aligned}$$

Between 6 pm and 6 am:

At 6 pm the temperature was 21°.

At 6 am it was 10°.

$$\begin{aligned} \text{Difference} &= 21^\circ - 10^\circ \\ &= 11^\circ \end{aligned}$$

Between 9 pm and 9 am:

At 9 pm the temperature was 19°.

At 6 am it was 10°.

At 9 am it was 15°.

$$\begin{aligned} \text{Change} &= (19^\circ - 10^\circ) + (15^\circ - 10^\circ) \\ &= 9^\circ + 5^\circ \\ &= 14^\circ \end{aligned}$$

The temperature changed the most between 9 pm and 9 am.

[Note: The difference in temperature between 9 pm and 9 am was not the greatest but the change in temperature over that time period was the greatest.]

8 He was late 30 out of 45 days.

$$\begin{aligned} \text{Probability of being late} &= \frac{30}{45} \\ &= \frac{2}{3} \end{aligned}$$

9 The number of men who were passengers

$$\begin{aligned} &= 106 - 79 \\ &= 27 \end{aligned}$$

The total number of passengers is 127.

The number of women who were passengers

$$\begin{aligned} &= 127 - 27 \\ &= 100 \end{aligned}$$

	Driver	Passenger	Total
Men	79	27	106
Women		100	
Total		127	

10 Sum of ages of male workers
 $= 30 \times 25$
 $= 750$

Sum of ages of female workers
 $= 20 \times 35$
 $= 700$

Total of all ages $= 750 + 700$
 $= 1450$

Total workers $= 30 + 20$
 $= 50$

Average age $= 1450 \div 50$
 $= 29$

11 NZ\$100 = A\$80

A\$80 = US\$60

Saskia would have US\$60.
