1.

In the figure,  $\hat{BEF} = 110^\circ$ ,  
 $\hat{EBC} = 40^\circ$ ,  $\hat{ADE} = 45^\circ$ .  $AC$ ,  
 $FD$  and  $EB$  are straight lines.  
Find the size of  $\hat{BCA}$ .

Give reasons.

2. In the diagram,  $AB = AD$ ,  $BC = BD$ ,  
 $AB \parallel DC$  and  $\hat{DAB} = 70^\circ$ .

Find the size of  $\hat{ABC}$ , giving reasons.

3.

In the figure,  $AB \parallel CD$ ,  $EG \perp GL$ ,  
 $EF = FH$ , and  $\angle LEG = 54^\circ$ .

Calculate, giving reasons,  
 the size of:

- (a)  $\hat{GHD}$       (b)  $\hat{EFL}$

4.

In the figure  $BC$  is a straight line,  $AD = DC$ ,  $AD = BD$  and  $\hat{C}AD = 29^\circ$ .

Find  $x$ , giving reasons.

5. In the figure,  $ABCDEF$  is a regular hexagon.  $DC$  and  $AB$  are produced to  $P$  and  $N$  respectively.

Deduce the size of:

- (a)  $\hat{FAB}$   
(b)  $\hat{NMP}$ , giving full reasons to justify your answer.

6.

In the figure,  $ABCD$  is a rhombus whose diagonals intersect at  $E$ .

If  $\hat{BCD} = 112^\circ$ , find the size of:

(a)  $\hat{AED}$

(b)  $\hat{ABD}$

(Give reasons.)

1.  $\hat{D}EA = 70^\circ$  (supplementary to  $\hat{B}EF$ )  
 $\hat{C}AB = 115^\circ$  (exterior angle of triangle  $ADE$ )  
 $\hat{B}CA = 180^\circ - (40 + 115)^\circ$  (angle sum of  $\triangle ABC$ )  
 $\therefore \hat{B}CA = 25^\circ$ .

2.  $\hat{A}BD = \hat{B}DA = 55^\circ$  (base angles of isosceles  $\triangle ABD$ )  
 $\hat{C}DB = 55^\circ$  (alternate to  $\hat{A}BD$  and  $AB \parallel DC$ )  
 $\hat{D}CB = \hat{C}DB = 55^\circ$  (base angles of isosceles  $\triangle BCD$ )  
 $\hat{D}BC = 70^\circ$  (angle sum of  $\triangle BCD$ )  
 $\hat{A}BC = \hat{A}BD + \hat{D}BC$   
 $= 55^\circ + 70^\circ$   
 $= 125^\circ$ ,  
 $\therefore \hat{A}BC = 125^\circ$ .

3. (a)  $\hat{F}HG = 54^\circ$  (alternate to  $\hat{L}EG$  and  $AB \parallel CD$ )  
 $\hat{G}HD = (180 - 54)^\circ$   
 (supplementary to  $\hat{F}HG$ )  
 $\therefore \hat{G}HD = 126^\circ$ .

(b)  $\hat{G}LE = 36^\circ$  (angle sum of  $\triangle GLE$ )  
 $\hat{H}EF = \hat{F}HG = 54^\circ$  (base angle of isosceles  $\triangle EFH$ )  
 $\hat{E}FH = 72^\circ$  (angle sum of  $\triangle EFH$ )  
 $\hat{L}FH = 36^\circ$  (alternate to  $\hat{G}LE$  and  $AB \parallel CD$ )  
 $\hat{E}FL + \hat{L}FH = \hat{E}FH$   
 $\therefore \hat{E}FL + 36^\circ = 72^\circ$   
 $\therefore \hat{E}FL = 36^\circ$ .

4.  $\hat{D}CA = 29^\circ$  (base angles of isosceles  $\triangle ADC$ )  
 $\hat{B}DA = 58^\circ$  (exterior angle of  $\triangle ADC$ )  
 $\hat{A}BD = \hat{D}AB = 61^\circ$  (base angles of isosceles  $\triangle ABD$ )  
 $\therefore x = 61$ .

5. (a)  $\hat{F}AB = \frac{(2n - 4) \times 90^\circ}{n}$   
 [angle in a regular hexagon ( $n = 6$ )]

$$\therefore \hat{F}AB = \frac{(2 \times 6 - 4) \times 90^\circ}{6} = 120^\circ.$$

(b)  $\hat{A}BC = \hat{F}AB$  (angle in a regular hexagon)  
 $\therefore \hat{A}BC = 120^\circ$ .  
 $\hat{B}CD = 120^\circ$  (angle in a regular hexagon)  
 $\hat{C}BM = 60^\circ$  (supplementary to  $\hat{A}BC$ )  
 $\hat{M}CB = 60^\circ$  (supplementary to  $\hat{B}CD$ )  
 $\hat{B}MC = 60^\circ$  (angle sum of  $\triangle CBM$ )  
 $\hat{N}MP = 60^\circ$  (vertically opposite to  $\hat{B}MC$ )  
 $\therefore \hat{N}MP = 60^\circ$ .

6. (a)  $\hat{AED} = 90^\circ$

(diagonals of a rhombus bisect at right angles).

(b)  $\hat{ABC} = (180 - 112)^\circ$  (co-interior to  $\hat{BCD}$  and  $AB \parallel DC$ )  
 $= 68^\circ$ ,  
 $\hat{ABD} = \frac{1}{2} \hat{ABC}$  (diagonals of rhombus bisect the angles through which they pass)  
 $= \frac{1}{2} \times 68^\circ$   
 $= 34^\circ$ ,  
 $\therefore \hat{ABD} = 34^\circ$ .
