

## Rates

A rate compares two quantities of a different kind.

Rates of Change

Rates

Gradients of Rates

### Rates of change

Graphs and tables can be used to show the rates at which chosen variables are changing with time.

e.g. The following graphs show the costs of running several businesses over the past 6 months.

The costs are rising steadily

The costs have been rising but now seem to have levelled out.

The costs are rising at an increasing rate.

The costs are falling after having reached a peak.

112

As can be seen from these graphs, rates of change can be represented by linear (straight line) graphs or non-linear graphs, such as growth curves.

For Business D the information on the graph could have been shown in a table:

| Month | Costs ( \$ '000) |
|-------|------------------|
| 1     | 27               |
| 2     | 34               |
| 3     | 40               |
| 4     | 45               |
| 5     | 44               |
| 6     | 41               |

## Rates

A rate compares two quantities of a different kind.

e.g. Speed is a rate which compares distance travelled with time

$$\text{Speed} = \text{kilometre per hour} \left( \frac{\text{km}}{\text{hr}} \right)$$

$$\text{Wage rate} = \text{Dollars per week} \left( \frac{\$}{\text{week}} \right)$$

| Example 1   | Answer   |
|---|--|
| A woman earns \$425 in 50 hours.<br>What is her hourly rate of pay? | Rate of pay =<br>$\frac{425}{50} = 8.5 \frac{\$}{\text{hour}}$ |
| Example 2   | Answer   |
| A motorist travels 85 km in 2 hours.<br>What is his speed?          | Speed = $\frac{85}{2} = 42.5 \frac{\text{km}}{\text{hour}}$    |

## Gradients and Rates

On a straight line graph the gradient is a measure of the rate at which one variable is changing with respect to the other variable. The larger the gradient, the quicker the rate of change.

e.g. The distance travelled by a train going at a constant speed is shown below.

| Time (hours) | Distance (km) |
|--------------|---------------|
| 0            | 0             |
| 1            | 30            |
| 2            | 60            |
| 3            | 90            |
| 4            | 120           |

From the table the speed =  $120/4 = 30$  km/hr

This data can be shown on a graph:

From the graph, the gradient = the speed =  $60/2 = 30$  km/hr.

## Rates

---

1. (a) A car travels from north of Sydney to Canberra, a distance of 360 km, in 5 hours. What is its average speed?

(b) The car uses 30 litres of fuel. What was its fuel consumption in km/litre?

2. Express each rate in its simplest form in the units given:

(a) 50 km in 5 hours in km/h

(b) 300 revolutions in 1 hour in revs/min

(c) 20 g per 5 cm<sup>3</sup> in g/cm<sup>3</sup>

3. The table shows the level of water in a water tank at different times as it is being drained at a constant rate.

The water is 50 cm deep at the start.

| Time (hours) | Level (cm) |
|--------------|------------|
| 0            | 50         |
| 1            | 40         |
| 2            | 30         |
| 3            | 20         |
| 4            | 10         |
| 5            | 0          |

(a) Use the table to find the rate at which the water level is falling.

(b) Sketch a graph to show this data, with time along the horizontal axis.

(c) What is the gradient of the line?

4. The table shows the relationship between the area and the radius of a circle.

The formula connecting them is  $A = \pi r^2$ . ( $\pi$  is given an approximate value of 3 in the table.)

| Radius (r) | Area (A) |
|------------|----------|
| 0          | 0        |
| 1          | 3        |
| 2          |          |
| 3          |          |
| 4          |          |

- Complete the table.
- Sketch a graph to show this data.
- Describe in words what is happening to the area of the circle as the radius increases.

## Rates

---

1. (a) 72 km/hr (b) 12 km/litre

2. (a) 10 km/hr (b) 5 rev/min (c) 4 g/cm<sup>3</sup>

3. (a) 10 cm/hr

(c) -10

4. (a) 12, 27, 48

(c) The area increases more rapidly as the radius increases.
