

EXERCISES – Trigonometry

Name: _____

1. Find (a) the angle θ and ...
(b) the area of the triangle

2. Find the angle θ

3. Simplify (a) $\frac{\text{Tan } x}{\sqrt{1 - \text{Cos}^2 x}}$

- (b) $\text{Cot } x \cdot \text{Cos}(90-x)$

4. A ship sails due East for 20 miles, then sails 30 miles at bearing 155°

Find:

- (a) How far the ship is from its original position, P.

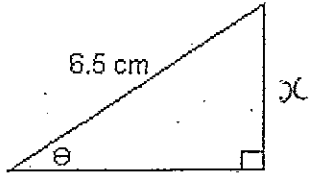

- (b) Its final bearing from P.

EXERCISES - Trigonometry

Name: Angelica T

1. Find (a) the angle θ and ...
(b) the area of the triangle

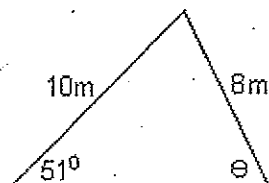

(a) $\cos \theta = \frac{6}{6.5}$
 $\therefore \theta = \cos^{-1} \frac{6}{6.5}$
 $= 22^\circ 37'$
 (nearest min)

(b) $x^2 = 6.5^2 - 6^2$
 $= 6.25$
 $\therefore x = 2.5$
 $\therefore \text{Area} = \frac{1}{2} \times 6 \times 2.5$
 $= 7.5 \text{ cm}^2$

2. Find the angle θ

$\frac{\sin \theta}{10} = \frac{\sin 51}{8}$

$\sin \theta = \frac{\sin 51 \times 10}{8}$

$= 0.9714...$

$\therefore \theta = 76^\circ 16'$ (nearest min)

3. Simplify (a) $\frac{\tan x}{\sqrt{1 - \cos^2 x}}$

$= \frac{\tan x}{\sin x}$

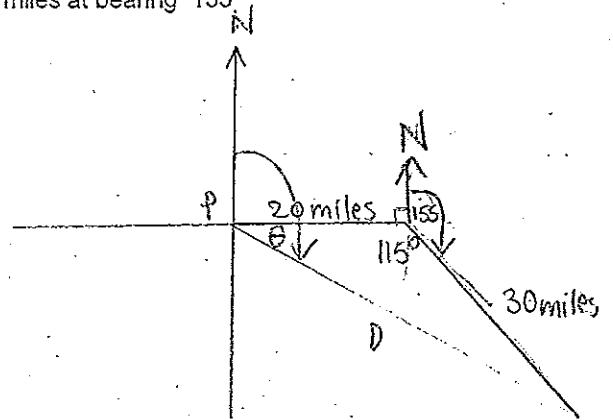

$= \frac{\sin x}{\cos x} \div \sin x = \frac{\sin x}{\cos x} \times \frac{1}{\sin x} = \sec x$

(b) $\cot x \cdot \cos(90-x)$

$= \frac{\cos x}{\sin x} \times \sin x$

$= \cos x$

4. A ship sails due East for 20 miles, then sails 30 miles at bearing 155°

Find:

- (a) How far the ship is from its original position, P.

$c^2 = a^2 + b^2 - 2ab \cos C$

$D^2 = 20^2 + 30^2 - 2 \times 20 \times 30 \times \cos 115^\circ$

$= 1807.1419$

$\therefore D = 42.5 \text{ miles (1 d.p.)}$

- (b) Its final bearing from P.

$\frac{\sin \theta}{30} = \frac{\sin 115}{42.5}$

$\therefore \sin \theta = \frac{\sin 115 \times 30}{42.5}$

$= 0.6396...$

$\therefore \theta = 39^\circ 46'$ (nearest min)

$\therefore \text{Final bearing} = 90 + 39^\circ 46'$

$= 129^\circ 46'$

Excellent work.
V. good setting out.
