Postage will be refunded.

Quantum technologies are beginning to move out of laboratory environments and into industrial applications.

Various devices now exploit quantum effects,

- Magnetometers
- Random number generation
- Accelerometers
- Gravimeters
- Clocks

www.idquantique.com

Imperial College

Quantum Magnetometers

- Recent funding announcements such as the EU Quantum Flagship and UK National Quantum Technologies Programme will only accelerate their adoption further.
- This paper has focused on two promising magnetometers developed by leading academic institutions, SMEs and Thales UK;
 - Atomic Magnetometer for Magnetic Induction Tomography (AMMIT) – University College London
 - MagCell – University of Strathclyde, INEX Microtechnologies and Fraunhofer Centre for Advance Photonics

Quantum Magnetometers

Quantum devices

- increases in sensitivity by several orders of magnitude.

Typical fluxgate

- resolve changes in magnetic fields below 1 nT.
- noise floor of less than $6 \text{ pT}_{\text{rms}}/\sqrt{\text{Hz}}$.

Quantum device

- aims for a resolution of a few pT or less.
- noise floor of $\text{fT}/\sqrt{\text{Hz}}$.

Ideally performance rivalling a Superconducting Quantum Interference Device (SQUID) magnetometer but cryogenic cooling and a smaller form factor.

Quantum Magnetometers - Uses

Increased performance, so how can we use it?

- Remote detection
- Remote inspection
- Vessel protection
- Navigation

modified from doi:10.3390/s90402271

Re-evaluate use cases where magnetics has benefits but in the past has been surpassed by other technologies.

Quantum Magnetometers - Uses

Remote Detection

CAE MAD-XR

1200m range

Can this be improved upon?

THALES

Quantum Magnetometers – Remote Detection

Remote detection of targets requires;

- a highly sensitive device
- low self-noise
- bandwidth from DC to several kHz
- Form factor and power requirement?

OPEN

THALES

Quantum Magnetometers – Remote Detection

- Magnetometers could be used for detection of low signature mines
- Acoustic solutions are ineffective in cluttered, shallow waters or the surf-zone
- Sensor fusion may be the only viable solution
- LIDAR could be an alternative

THALES

Quantum Magnetometers – Remote Inspection

■ Thales UK and UCL have recently conducted a research task to develop magnetometers under Innovate UK project 131885

■ The main technique researched was Magnetic Induction Tomography (MIT),

- tomography is an imaging technique that produces slices, or sectional, images of the object under inspection.
- Commonly used in;
 - Medicine,
 - Geophysics,
 - Non-Destructive Testing

<http://sine.ni.com/cs/app/doc/p/id/cs-13088#>

Quantum Magnetometers – Remote Inspection

■ MIT has been shown to image metallic objects even through screening materials.

➤ Applications in;

- border security
- Parcel scanning
- Container inspections
- Investigating the insides of buildings

<https://kaes.com.sa/solution/turnstiles/>

- ### ➤ For fast screening of parcels or containers the key requirements for a device would be sensitivity and noise floor. The form factor and power requirements can be offset if the technology provides a viable solution.

Quantum Magnetometers – Vessel Protection

Degaussing Systems

- Fluxgates are commonly used for degaussing systems
- Small, low power
- Have sufficient sensitivity

Signature Ranging

- Multi-Influence ranges
- Conflicting requirements which increased sensitivity of magnetometers could overcome

<https://electronica-submarina.com/underwater-measurement-category/mirs-signatures-measurement-for-ships-and-submarines/>

Quantum Magnetometers – Navigation

- As well as increased sensitivity another benefit of quantum magnetometers is that they do not required calibration.
- A magnetometer based navigation device works by detecting ripples in the Earth's field and detecting previously mapped anomalies.
 - Could be used in GPS-denied environments as part of a navigation system.
 - Combined with quantum accelerometer and quantum roll sensors.
 - A quantum inertial navigation system (INS).

Quantum Magnetometers – Theory of Operation

- The devices considered have similar principles of operation and components.
- Both types consist of a laser, a vapour cell and a photo-detector.
- Different measurement techniques can employ lock-in amplifiers and secondary magnetic field generation.

Fenici, "Comparison of magnetocardiographic mapping with SQUID-based and laser-pumped magnetometers in normal subjects"

Quantum Magnetometers – Theory of Operation

- **Step A) - The atoms in the vapour cell are un-polarised.**
- **Step B) - The laser optically pumps the cell and aligns the spin of the atoms (typically Caesium, Rubidium, Helium or Potassium). The spin of the electrons in the atom to process at a known frequency.**
- **Step C) - An external magnetic field (such as from a target) causes a shift in the rate of precession known as the Larmor frequency.**
- **Step D) - The Larmor frequency is proportional to the external magnetic field and can be measured.**

doi: 10.1117/12.2195482

Quantum Magnetometers – AMMIT

- Atomic Magnetometer for Magnetic Induction Tomography (AMMIT) – University College London.
- Could be considered an 'active' device.
- Stimulates eddy currents in a conductive target.
- Eddy currents generate a measurable secondary magnetic field.
- Target must be conductive but not necessarily magnetic.

THALES

Quantum Magnetometers – AMMIT

Experimental setup

OPEN

Quantum Magnetometers – AMMIT

- AMMIT Waterlip Quarry experiment demonstrated target detection at useful ranges.
- UCL have also demonstrated detection and localisation of underwater targets in a laboratory environment and have reported a reported noise floor of $130\text{fT}/\sqrt{\text{Hz}}$.

Quantum Magnetometers – MagCell

■ MagCell – Field Demonstration of Atomic Vapour Cell Magnetometry – Innovate UK Grant 103999.

➤ Thales UK, University of Strathclyde, INEX Microtechnologies and Fraunhofer Centre for Advanced Photonics.

■ Could be considered an ‘passive’ device.

■ Scalar Magnetometer

■ The double resonance technique results in a versatile sensor capable of measuring both static and alternating magnetic fields to a high degree of accuracy.

OPEN

THALES

Quantum Magnetometers – MagCell

- Noise floor compared to COTS device.
- Measured at Underwood Quarry as $3.4\text{pT}/\sqrt{\text{Hz}}$ initially but subsequently improved to approximately $1\text{pT}/\sqrt{\text{Hz}}$ in further quarry tests.

OPEN

Quantum Magnetometers – MagCell

■ Tests against representative ferromagnetic targets and controllable electromagnets designed for the experiment.

Conclusions

Two promising devices have been developed;

- One active device (AMMIT) – target does not need to be magnetic,
- One passive device (MagCell).

Experimental evidence for both magnetometers provides useful detection ranges – offering benefits over acoustic technologies in noisy environments

MagCell 'SWAP' potentially easier to exploit at this time.
