10m BACKGROUND INFO:
Thank You for Taking Part
 This is an academic study to assess the potential of **Crowdsourcing for MoD Procurement**.
 Play a **Serious Game**, think of a **better display**, send **feedback**. Help design a new interface for **Electronic Warfare** equipment.
 Click to learn more, or go to a 'Game Level'.

20m How to Make the Game Run
 In addition to the controls for the displays and sensors, there're also controls to **'fly' your helicopter** from a Frigate's flight deck on a **Maritime Search** mission.
 The **game controls** are on the main game display as well so you need to know how they work and what they represent in the real world.

20m What's Electronic Warfare?
Electronic Warfare is all about the use or denial of the electromagnetic spectrum (radar, radio, laser, infra-red, ultra-violet).
 This Serious Game is about one part of Electronic Warfare called **'Electronic Support'**.
 Electronic Support equipment **detects and identifies radars** looking at you.

20m What About My Radar?
 You get displays and controls that you might have in a **maritime helicopter**.
 That includes a **radar** display. As you take-off from a ship you can **turn on the radar** to search for ships.
 All ships look similar on radar, and don't forget that the **enemy will be able to see your radar** in the same way that you can see their radar.

20m How To See The Bad Guys
 The game is all about finding the 'bad guys'.
 You'll see their radars on your **Electronic Support** equipment.
 You might be able to find them using **Radar - ISAR**.
 But you'll need to see them to be sure. So there's also an **Electro-Optic Camera**

10m All About Scoring Points and Winning Medals
 How the Game Scores your performance.
 How to Avoid losing points.
 How Scores relate to Medals

Electronic Warfare   Name: martin Save   **Search Game**

10m THE BACK STORY
 Protection of a self-declared **Economic Exclusion Zone** is viewed by the UN as Piracy
 The nation of **Northland** claims control of the sea and the sea bed out to 200nm but that covers a busy shipping lane.
 When **Northland Patrol Boats** intercept merchant ships to collect transit fees the UN says that's **'Piracy'**.

30m GAME LEVEL 1
Getting Started
 An introduction to the scenario and the sensors available.
 This is a low shipping density scenario to let you settle in.
 The ESM Library Matching is fully correct for Hostile radars.

30m GAME LEVEL 2
OP 'Duck Shoot'
 A medium number of background ships with the Northland Patrol Boats in overt EMCON.
What's EMCON?
 ESM Library Matching is mostly correct.

30m GAME LEVEL 3
OP 'High Gun'
 A high density of background shipping with an unknown Northland EMCON.
 ESM Library Matching is partially correct.

30m GAME LEVEL 4
OP 'Soft Touch'
 A high density of background shipping with unknown Northland EMCON.
 The search has to be completed with passive sensors only (no Radar allowed - covert EMCON).
 ESM Library Matching is marginally correct.

30m GAME LEVEL 5
EX 'Gold Tinker'
 Define your own Mission, Search Area, Shipping, Radars and ESM System Bearing Error.
 This lets you experiment and try some 'What If?' questions you might have.

Training Levels

What About My Radar?

You get displays and controls that you might have in a **maritime helicopter**.

That includes a **radar** display. As you take-off from a ship you can **turn on the radar** to search for ships.

All ships look similar on radar, and don't forget that the **enemy will be able to see your radar** in the same way that you can see their radar.

Close

Searching With A Radar.

After turning the radar on, you'll need to adjust the **Range Scale**.

RADAR RANGE +
ZOOM OUT

RADAR RANGE -
ZOOM IN

RADAR_ON
40nm

The radar uses different pulse widths and repetition frequencies depending on the range selected. The radar can search out to 80 miles.

The **Plot Display** can also be adjusted, zooming in or out to get a better look at the radar contacts in your search area.

DISPLAY +
ZOOM OUT

DISPLAY -
ZOOM IN

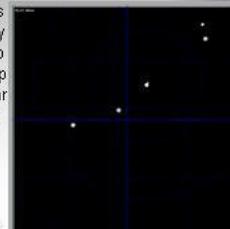

There are **radar range circles** and **map grid lines** on the Plot Display to help judge distances.

What's It Look Like?

The **Plot Display** shows the radar returns as grey blobs. There's no way to know the size of the ship from the size of the radar return as this depends on its construction.

The **Plot Display** is a ground stabilised plot which means that your own helicopter marker and all the ships move according to their true course and speed. North is always at the top of the display.

Your own helicopter marker also has a heading 'nose' to show which direction you're going in.

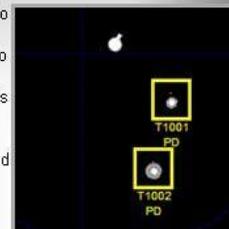

Getting a Better Look.

The radar also has a built-in **Track While Scan (TWS)** facility.

Click on a radar return to start the **TWS**. The TWSs stay locked on to the radar returns and even if the radar return is lost they continue to move along the last known course and speed to give a 'best guess' position.

The details for all the TWSs are shown in a Tote labelled **TK_TOTE**. This gives their position, course and speed.

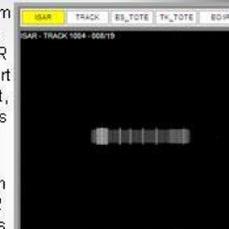

TK	LAT	LONG	GRD	SPD	ENW	ID	REG	CLS	MUZ
1001	482	515	054	12	S	PD	---	---	5
1002	489	514	209	01	S	PD	---	---	5

Later, when you've identified them this tote also shows their details.

What's Inverse Synthetic Aperture Radar?

Inverse Synthetic Aperture Radar (ISAR) is a form of imaging radar. The **doppler shift** from returning radar pulses from your own radar, are used to make a two dimensional picture of the real three dimensional ship.

Range, or distance from your own helicopter is shown across the ISAR display. The closest part of the ship is on the left, and the furthest point is on the right.

Doppler shift is shown up and down the ISAR display. Zero doppler is along the centre, with high and low doppler shown up and down the screen.

The **strength of the radar return** is shown by the intensity of the grey shading, so that areas of strong radar reflectivity are shown white or light grey.

You're now ready to try out your new knowledge - Game Level 1c - Introduction to Radar
