

# PET sensor VERA-NG as a part of GBAD

Presented by Vojtech Stejskal  
([v.stejskal@era.aero](mailto:v.stejskal@era.aero))

## Passive ESM Tracker (PET)

- What is PET system
- Principle and key properties
- PET use cases
  - A. RECCE
  - B. GBAD

## Ground Based Air Defense (GBAD)

- PET integration into AD
- PET properties supporting GBAD
- EW simulator supporting AD training
- Fictive GBAD scenario supported by EW simulator

## What is

*„DPET (Deployable Passive Electronic Support Measures (ESM) Tracker) sensor provides long-, medium-, and short- range all altitude surveillance coverage of manned and unmanned fixed wing and rotary wing airborne vehicles (AVs) excluding Tactical Ballistic Missiles based on employing Time Difference of Arrival (TDOA) techniques exploiting any RF signal emitted by the AV, that optionally may be supported by Angle of Arrival (AOA) techniques.“*

*„In addition, the DPET system provides the principle source of non-cooperative target identification (NCTI) based on determination the waveform parameters of any AV emission and automatic comparison these to a system database.“*

NCIA definition

Definition would desire extension by ground and naval platforms as a targets. PET origin is related with ballistic missile tracking.

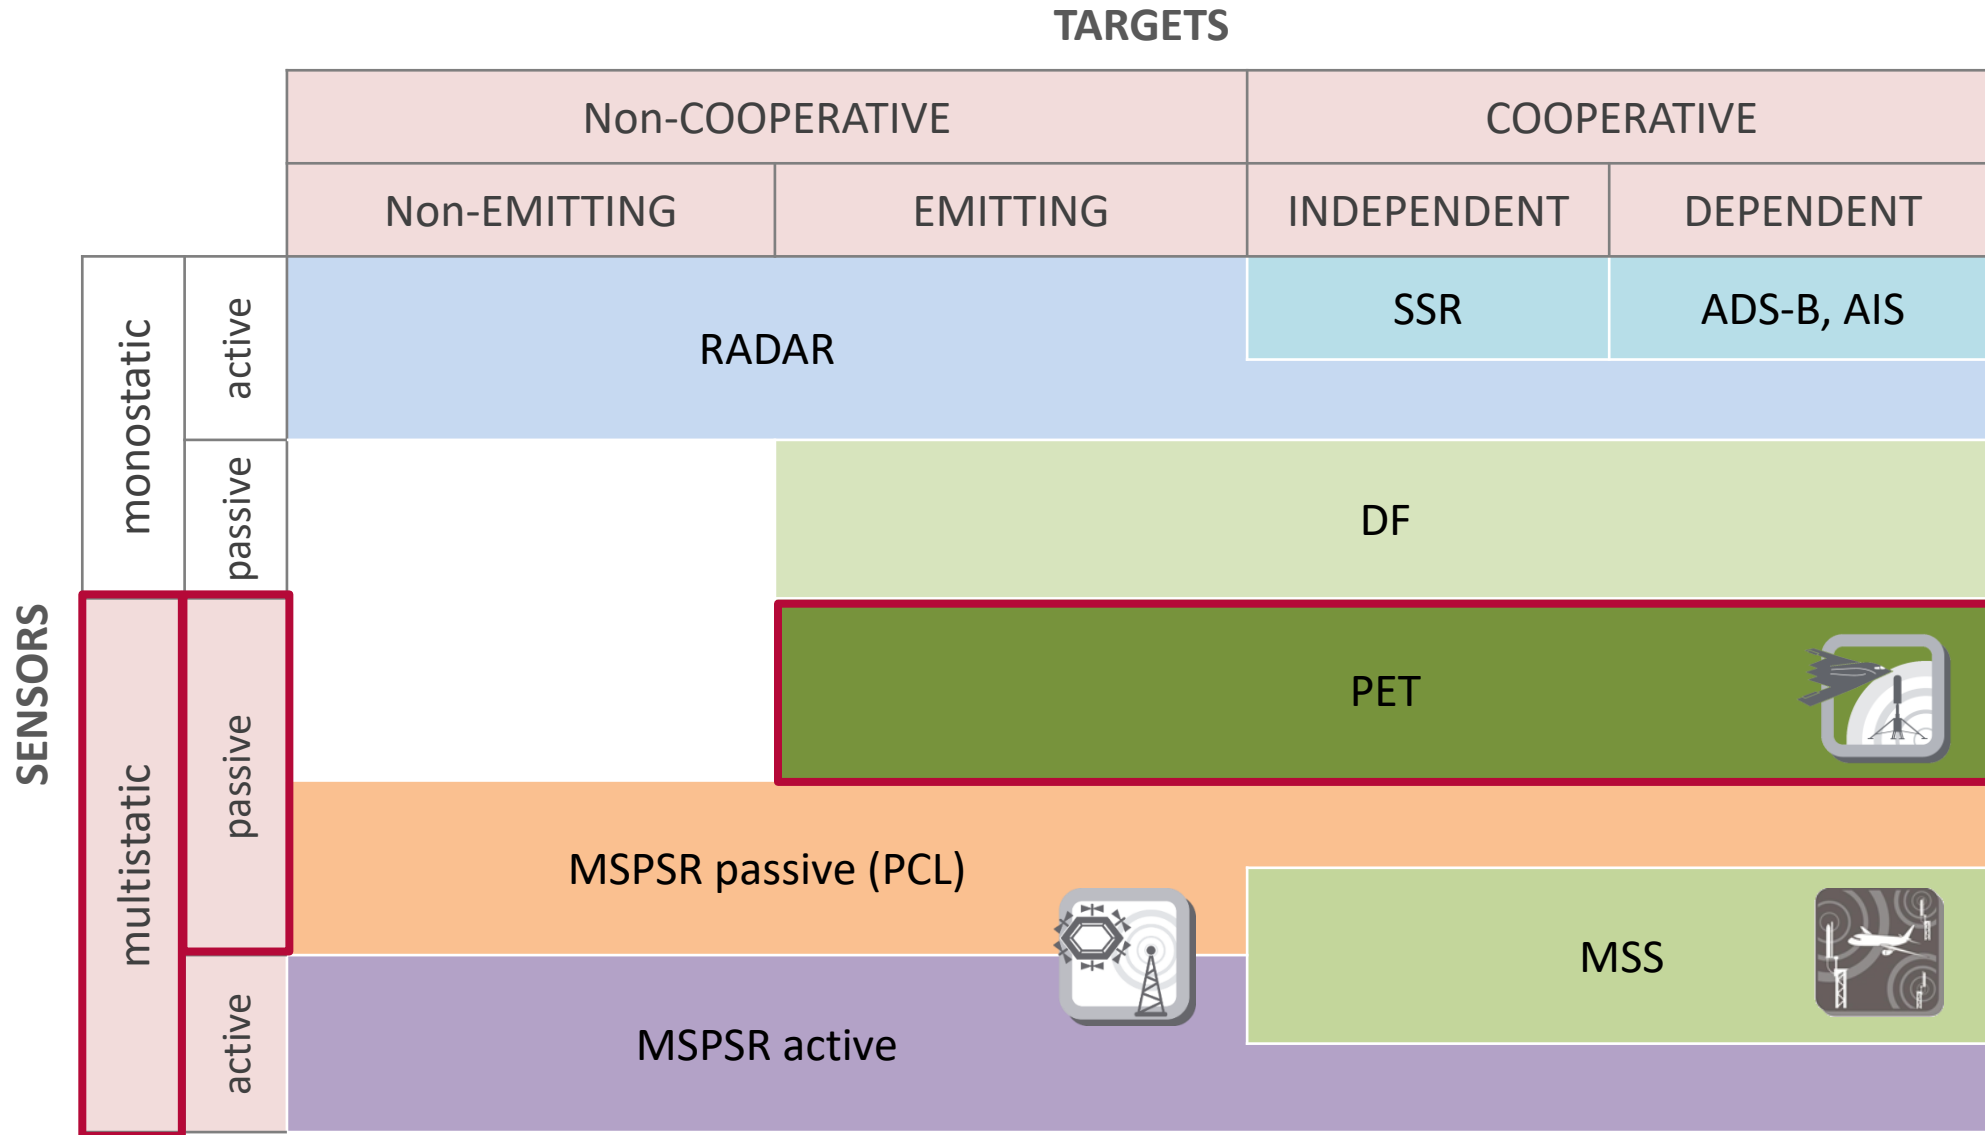

## What is not

**Recent trend is to call also any Direction Finding (DF) system PET when DFs do not support real time target tracking as PET abbreviation claims.**

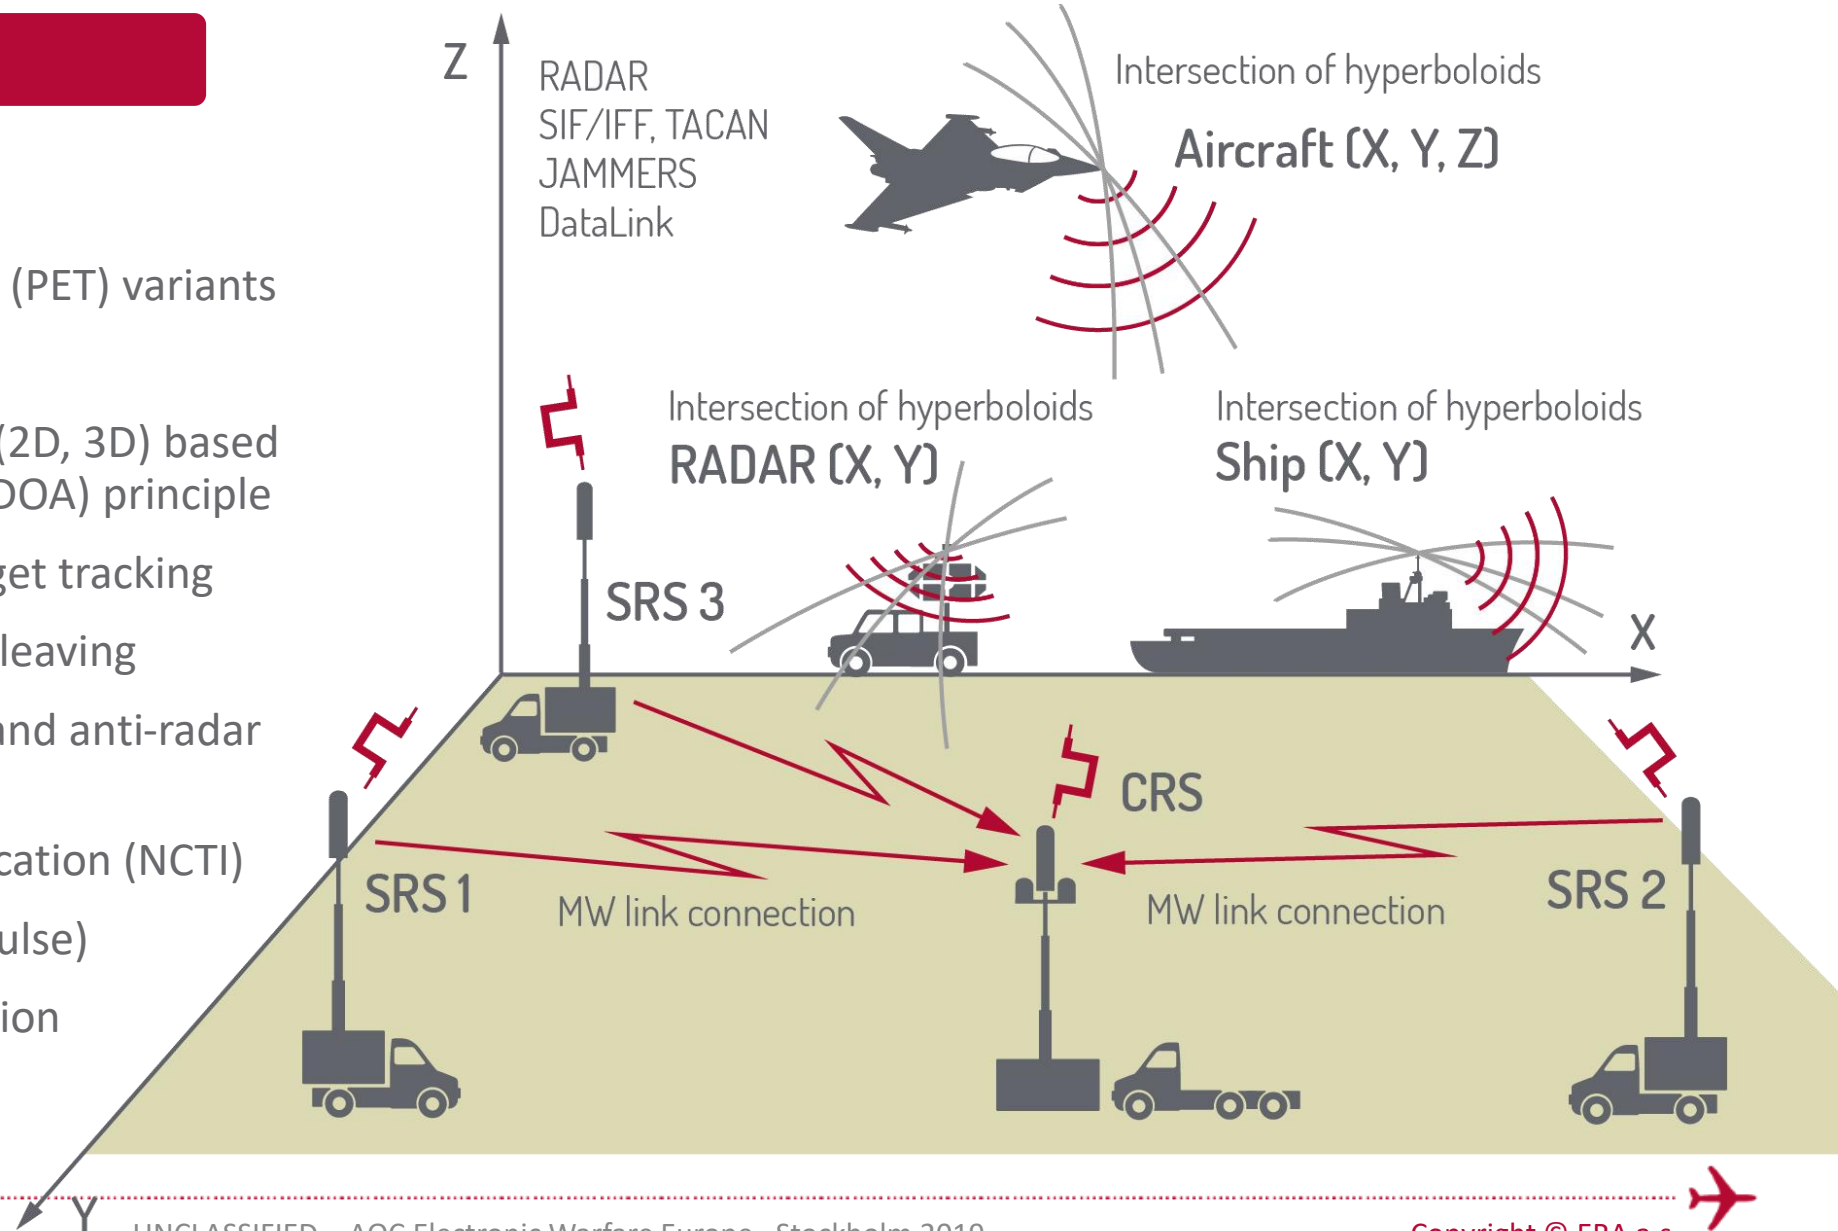

Target detection, tracking and identification approaches

MONOSTATIC  
VS  
MULTISTATIC

## Key Features

- Multisite sensor system
- Deployable (DPET) or stationary (PET) variants
- Covert mode of operation
- Target localization and tracking (2D, 3D) based on Time Difference of Arrival (TDOA) principle
- Real time and very accurate target tracking
- Parametrical and spatial deinterleaving
- Resistant to EM&GPS jamming and anti-radar missiles
- Non-Cooperative Target Identification (NCTI)
- ELINT analysis (inter and intra-pulse)
- Emitter Database (EDB) production

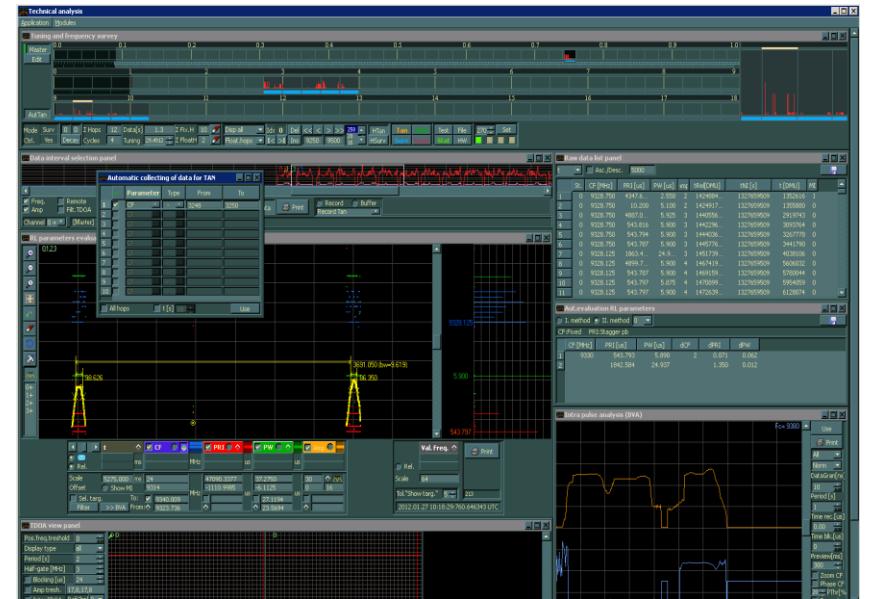

ROLE	Surveillance  AD (Air Defence)	Reconnaissance  EW (Electronic Warfare)
Tasks	Real-time target tracking Target identification (NCTI)	Signal analysis Target localization Emitter Database (EDB) production ELINT data distribution
Integration	Proprietary format ASTERIX, AWCIES	Proprietary format CESMO, EOB, NEDB
Customer	ACC/ARS/DARS/GBAD	EWCC/SEWOC/EDB authority

Sensor can support both use cases at the same time.

# RECCE

Also for GBAD  
is good to  
know.

## Challenges

- **Novel** sophisticated type of **emitters** with complex signals (multimode, random, MoP)
- To get clear **signal representation** in congested environments and assign it correctly to emitter/platform assignment
- To **rough definition of EDB content** (against automatic NCTI)
- **Data exchange interoperability** (in between platforms)

N036 Byelka (source Wikipedia).

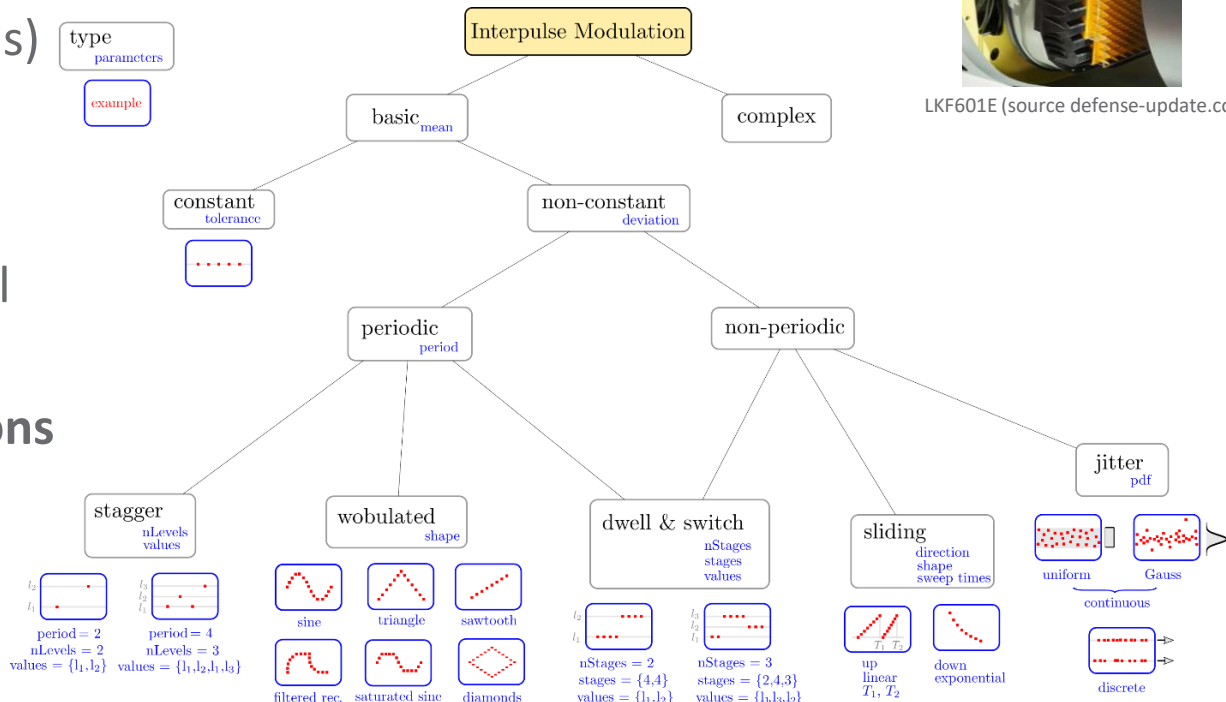

LKF601E (source defense-update.com).

## All about Emitter Database

- PET provide **very accurate EDB records** due to spatial deinterleaving
- PET also contributes to **exchange format modifications**
- PET **supports automatic NCTI**

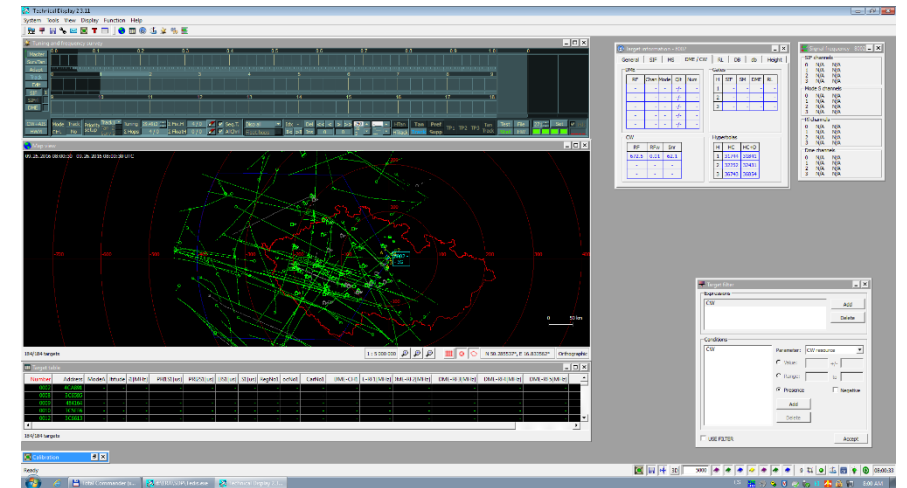

## Target identification is crucial for GBAD

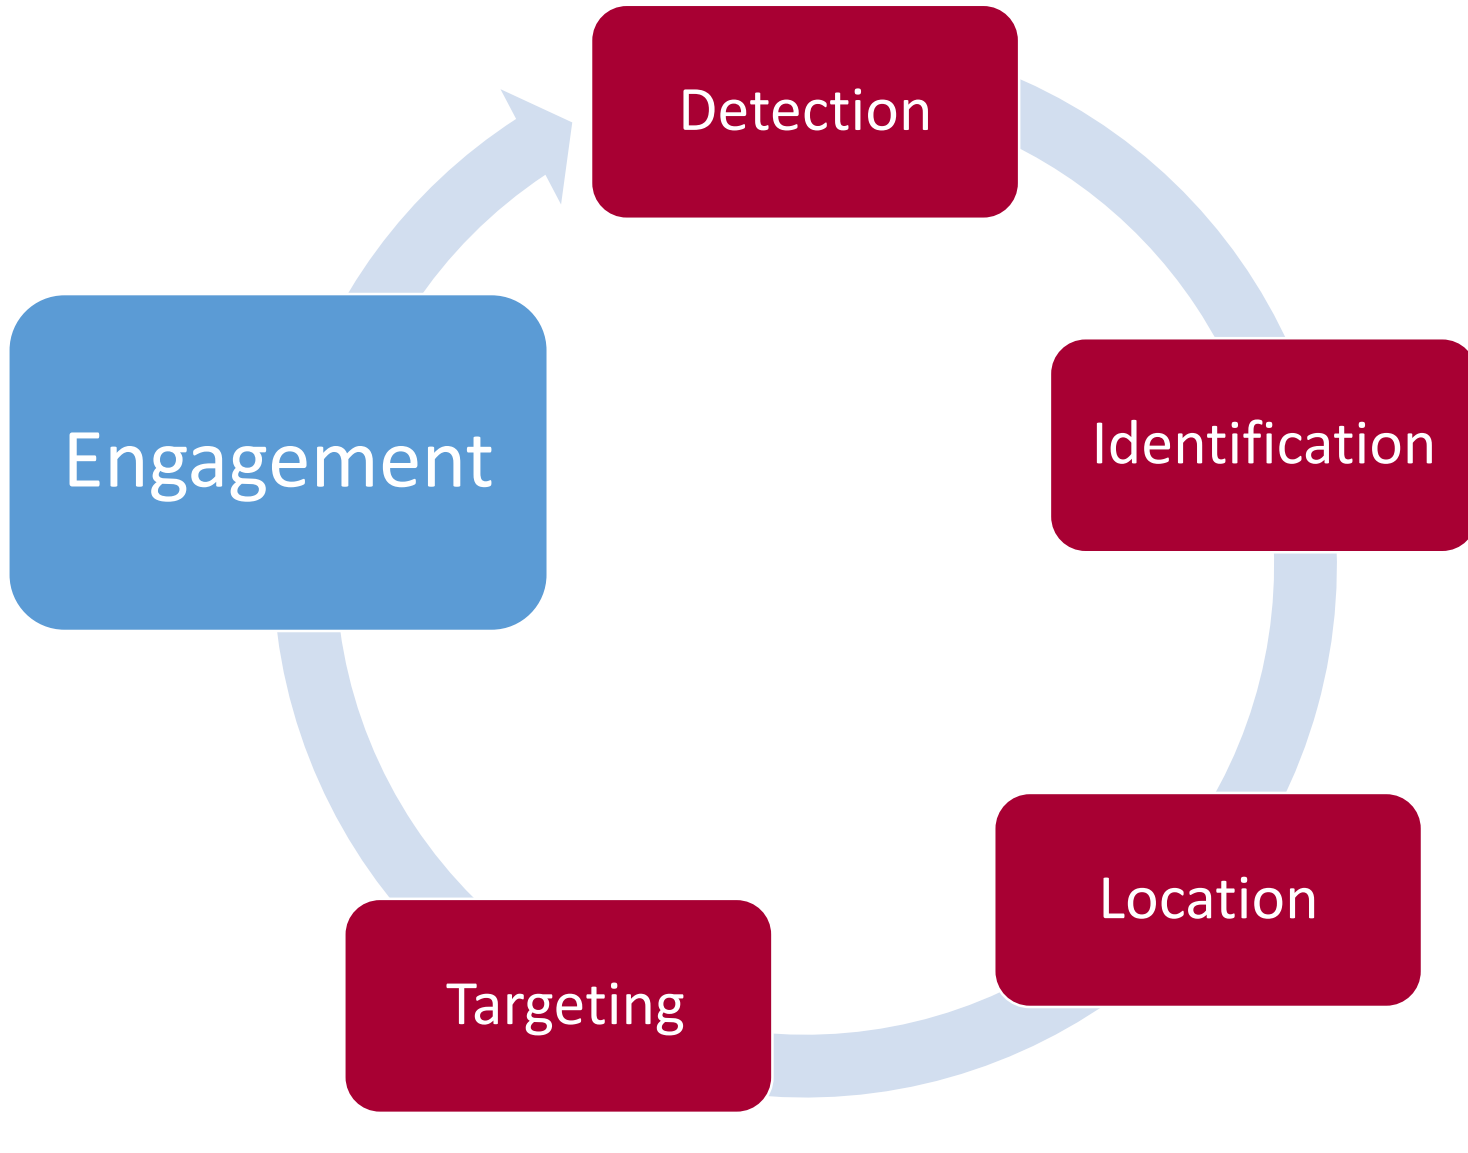

# GBAD

It is good to know very quickly and precisely.

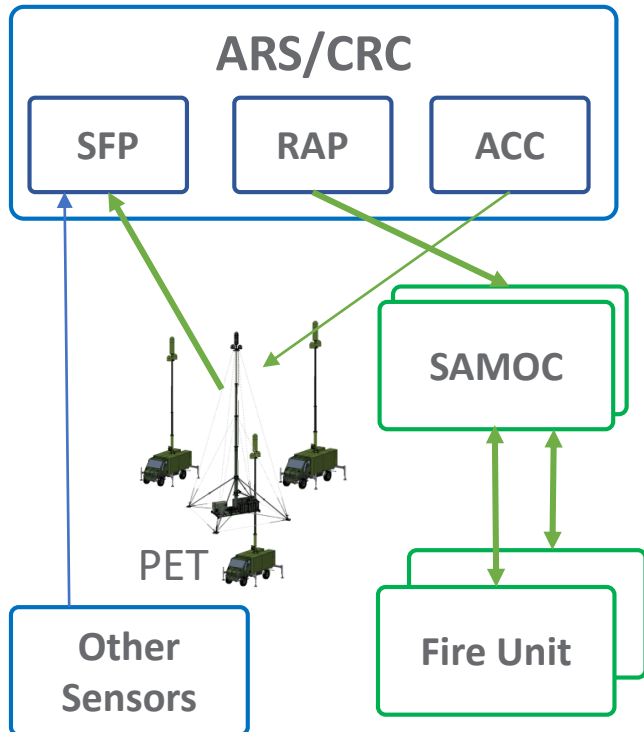

SAM system

PET system

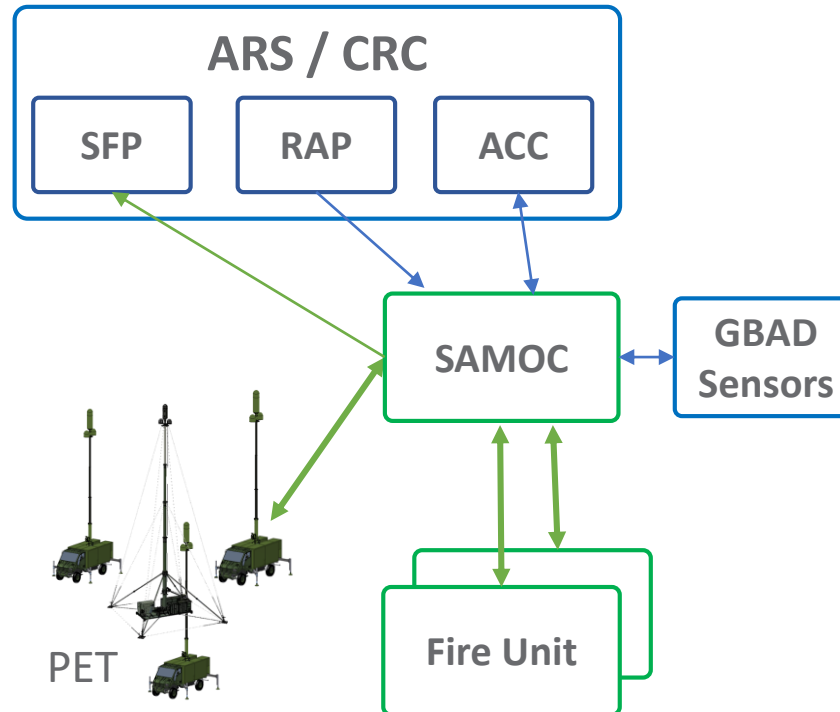

## AirC2

PET fused with other sensors in SFP and distributed as RAP  
 PET is tasked from ARS  
 RAP latency of several seconds

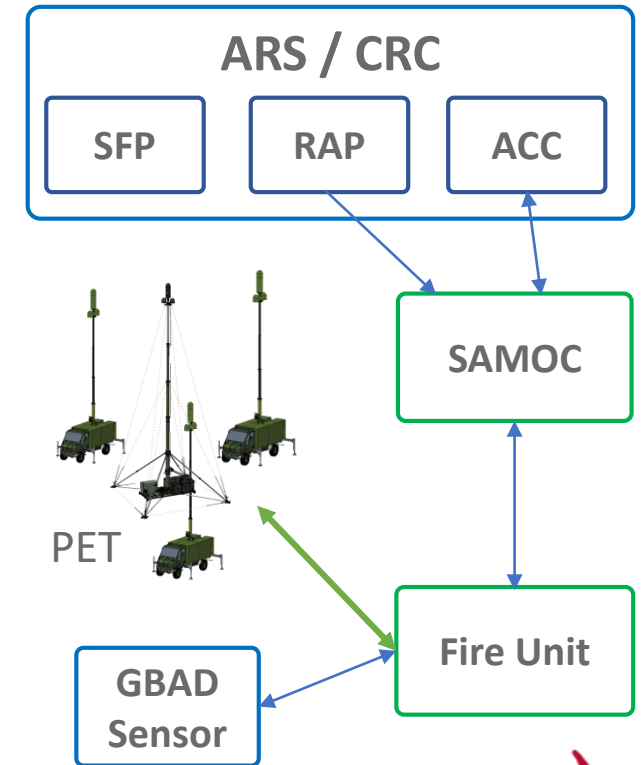

## GBAD

PET is fused in SAMOC with GBAD sensors and provide information to ARS SFP -> RAP  
 PET is tasked from SAMOC  
 IFF and FU units support

## FU

PET is directly tight with FU and SAM system  
 Full PET control  
 Target acquisition and engagement

GBAD

Is PET information good enough?

Frequency range 50 MHz – 18GHz

Surveillance area up to 400 km

Up to 500 real time tracks

3 dimensional tracking capability

All weather conditions

Antenna 100 kg and 500x1720 mm

Modern emitters including radars, datalinks, jammers, navigation, identification and other signals.

## Example

Base - horizontal 15 km  
 Base - vertical 1500 m  
 Distance to target 100 km  
 $\sigma_{TDOA}$  e.g. 10ns

**Cross range angular error**

$$\alpha = 3/15000 = 0.0002 \text{ rad} = \mathbf{0.01^\circ}$$

**Cross range error**

$$\text{Cross range error} = \alpha \times R = 0.0002 \times 100000 = \mathbf{20 \text{ m}}$$

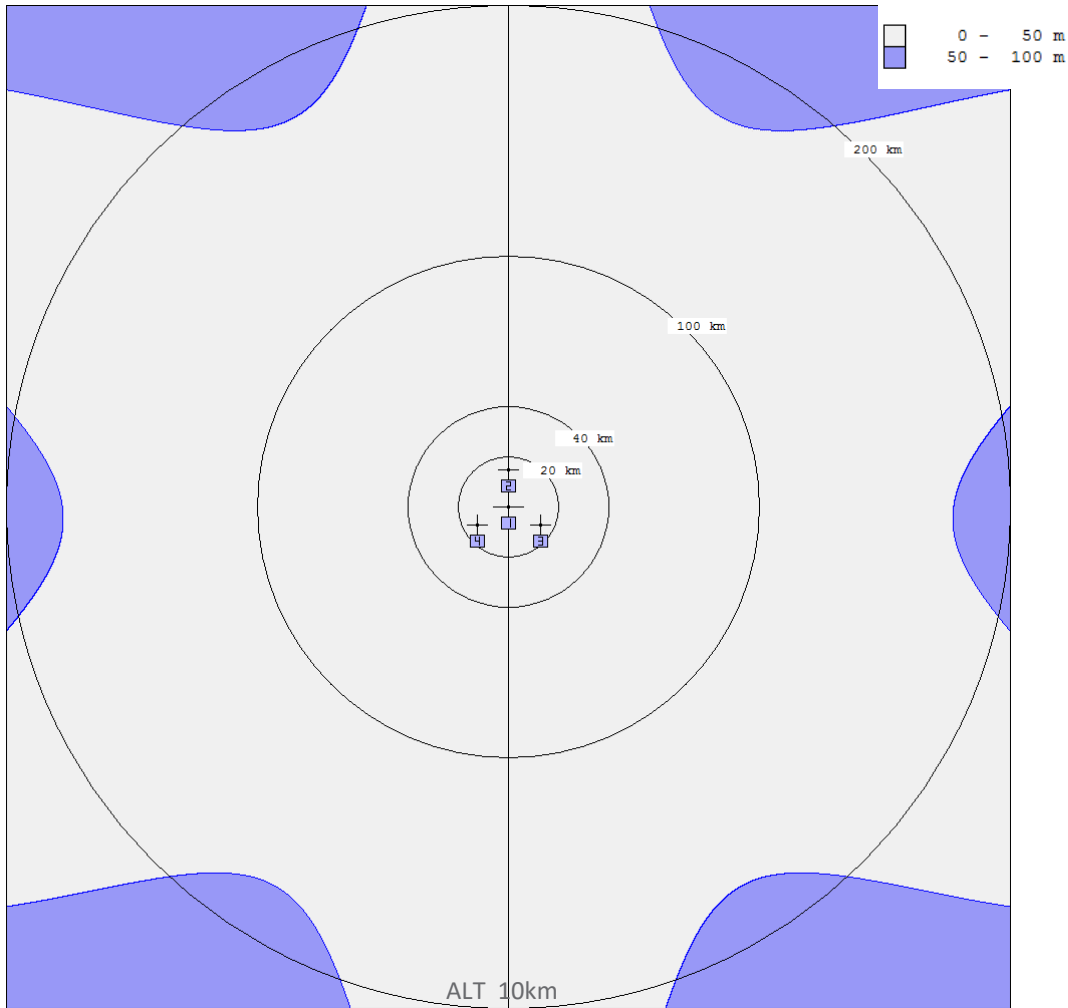

**Height angular error**

$$\alpha = 3/1500 = 0.002 \text{ rad} = \mathbf{0.1^\circ}$$

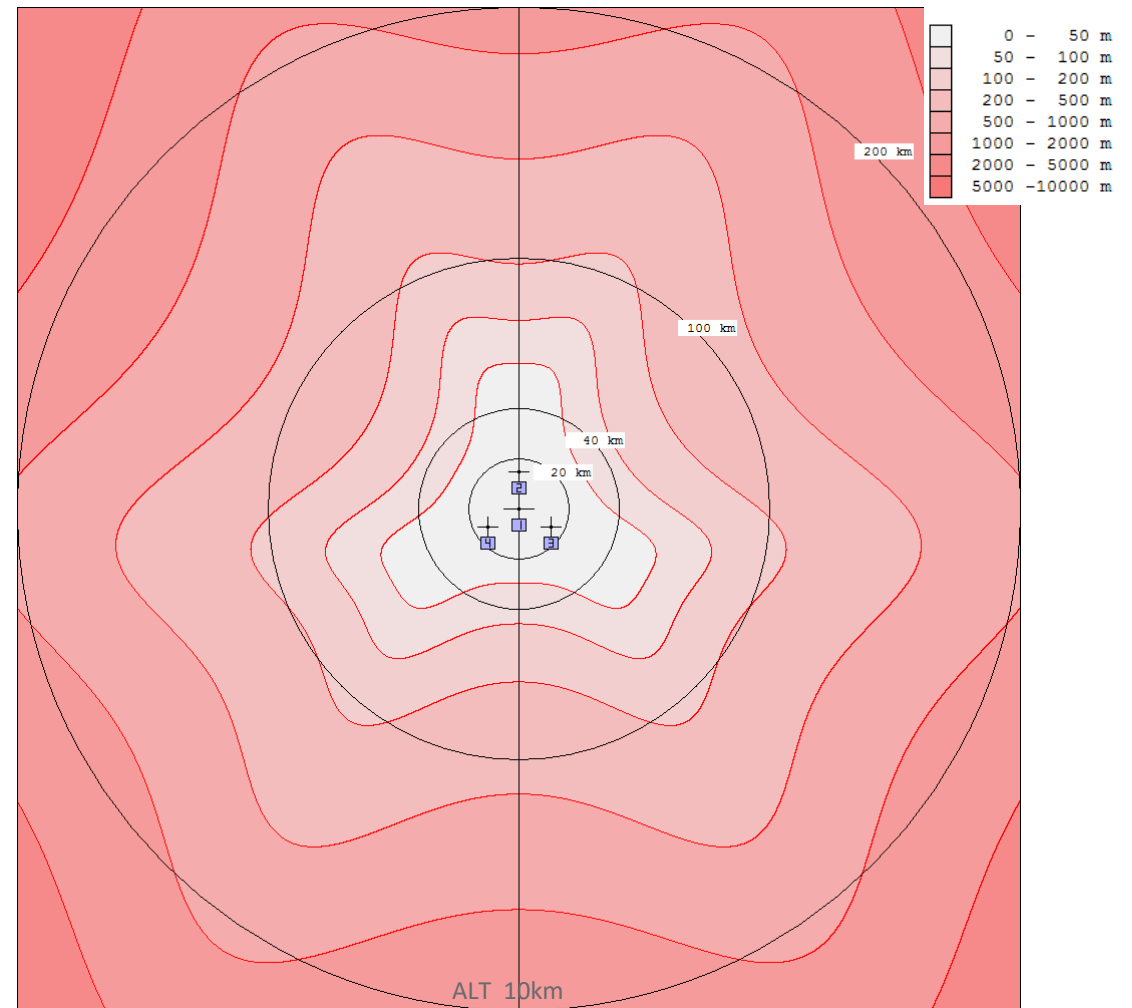

**Height error**

$$\text{Height error} = \alpha \times R = 0.002 \times 100000 = \mathbf{200 \text{ m}}$$

**Cross range error**

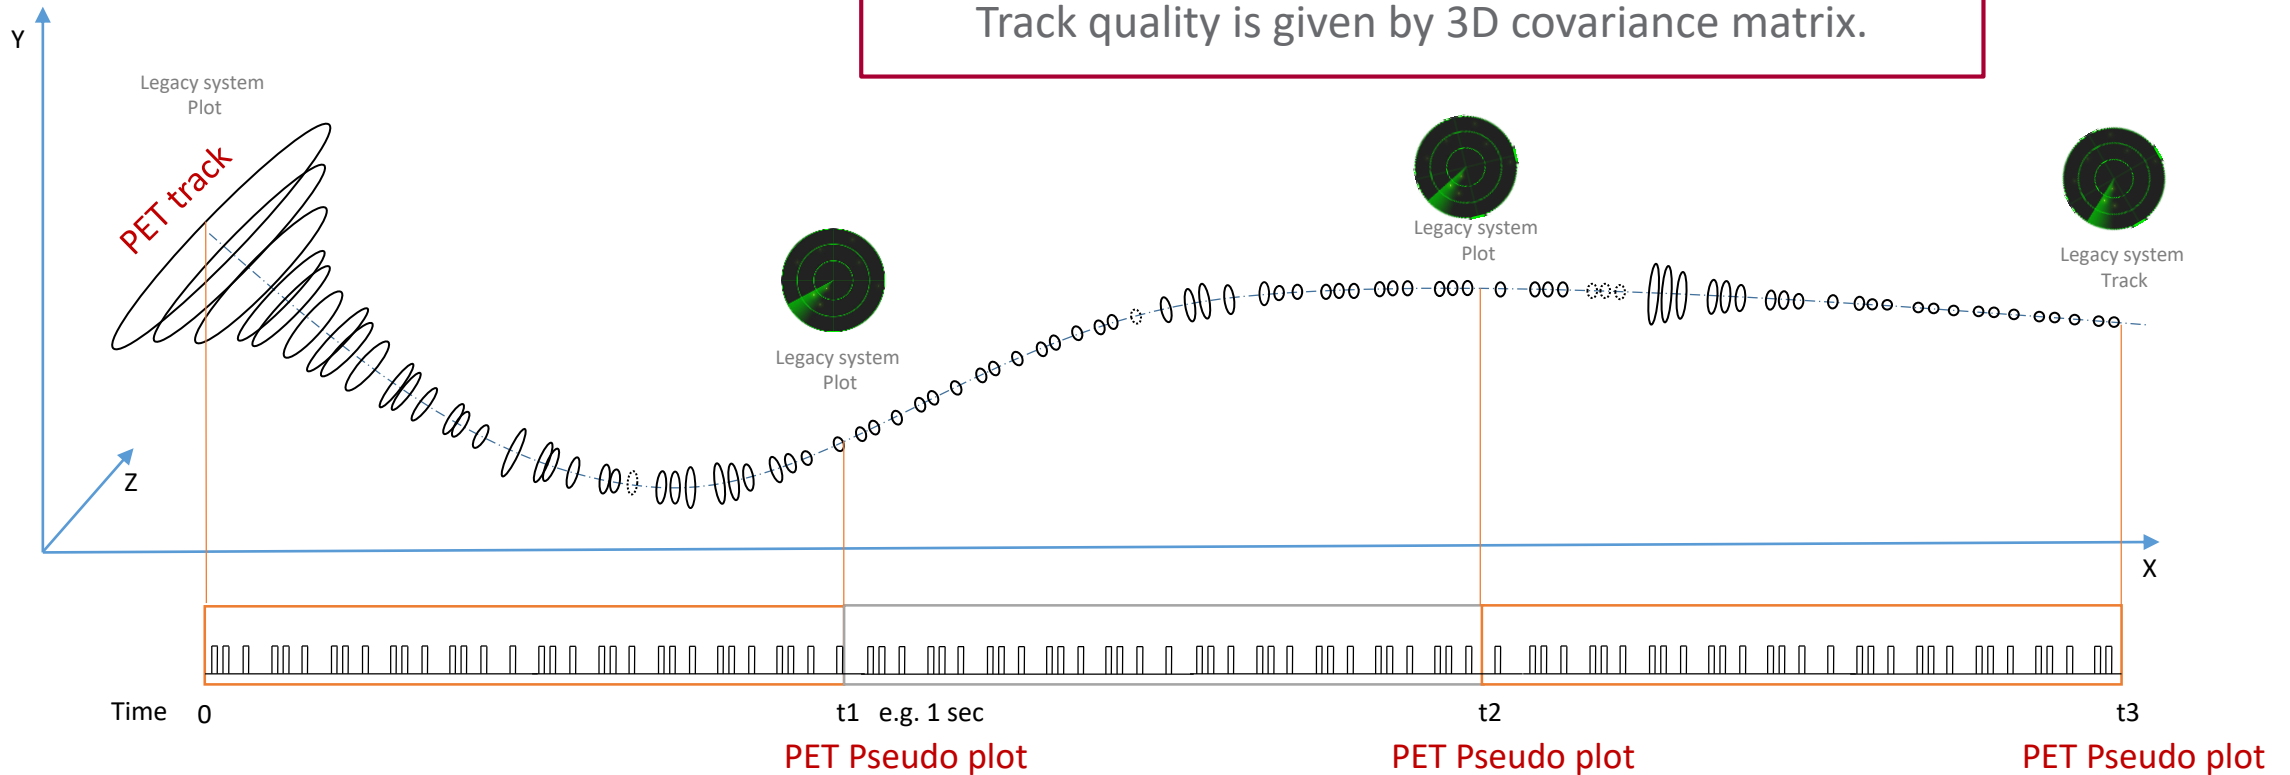

**Vertical error**

## Track before plot

Target position is formed from the beginning as track.  
Track quality is given by 3D covariance matrix.

- Output update rate is configurable (1-15 sec). Lower number is not feasible (hundreds targets at the same moment).
- **Priority targets with higher update rate** are optional.
- Multichannel output function (several AWCIES, AST, UFE outputs with different content regarding data consumer).

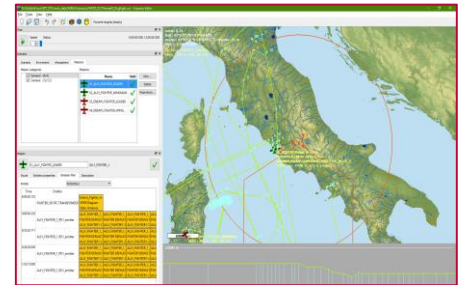

# PET in action

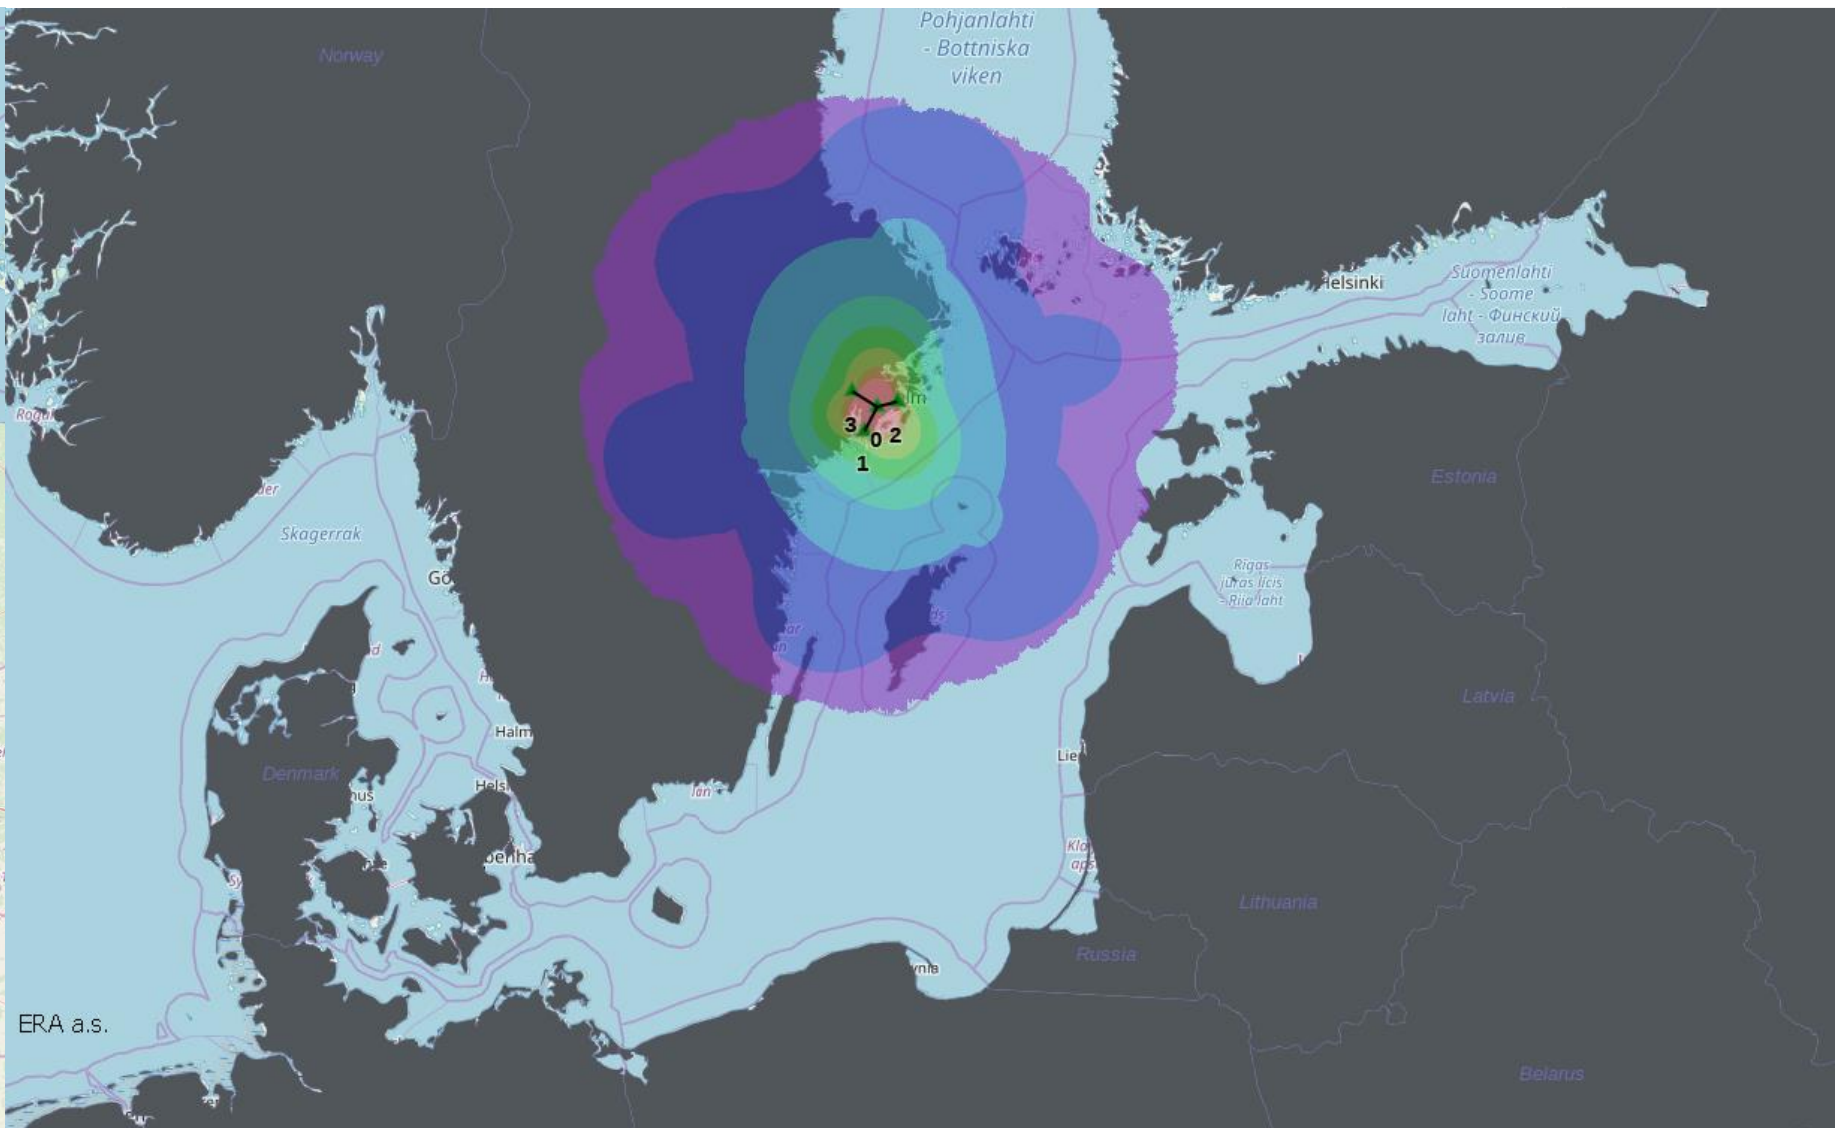

Fictive scenario when PET supports GBAD generated by ERA EW Simulator.
