

Welcome to CyFlex.com:

A collaborative portal for user information sharing!

What is CyFlex?

CyFlex is a real-time, data acquisition and control system environment currently in use at major engineering facilities in the U.S. and around the world.

Scalability

Because of the power and flexibility of CyFlex, it can be applied in testing and measurement applications that range from small, simple tests managing just a few parameters, to very large, complex tests involving hundreds of real-time measurements and control of any number of parameters and subsystems.

Modularity

CyFlex is organized into "feature rich" generic function modules. Each module can be "configured" to support the needs of the test application through parameters.

Highest ROI

In spite of the power and versatility of CyFlex, it offers the best bang-for-the-buck, compared to the competition.

Flexibility

Users can reconfigure CyFlex to perform many types of tests without the expense of purchasing new software, I/O, or programming services.

Management Tools

CyFlex test facility management tools improve test cell utilization, resulting in shortened investment payback and reduced product development times.
