SALLI® Saddle Chairs – the active way to sit

In dental care the sitting position is the greatest health risk, because during long operations the position is unnatural and involves a lot of repetitive movements. Sitting in a bad position puts twice as much strain on the spine as standing.

More than a half of European dentists retire early because of various problems in their shoulders, neck and lower back. Almost everybody working in dentistry is affected by poor circulation in the lower extremities, shortage of oxygen, problems in hip, knee and shoulder joints, or genital health problems.

One chair for the whole day

On a two-part saddle chair the back is in the same position as when standing, and the lower back lordosis can be maintained. On one-part saddle chairs there is a lot of pressure on the genital area which makes people round their back. That position is a tremendous health risk for the disks and vertebrae in the lower back.

The joint-friendly 135 degree angle in the knees and between the thighs and the upper body means a diminished risk of arthritis. The circulation in the lower limbs is good, causing no swelling and varicose veins.

The active seat in Salli SwingFit and Salli Swing guarantee the wide hip angle even in positions where you need to lean forward. The weight of the upper body is always evenly divided on the seat because the seat adapts to your movements. It is also easy to activate core muscles on the active seat.

Working is easy

Because there are no arm or back rests it is easy to sit down and get up, and to reach for equipment. The chair rolls effortlessly and gets you near the patient; visibility into the patient's mouth is good.
