

Easy and practical siren
management,
wherever you are.

SEV-ALERT Software

Activate, test, and monitor
SEV-Squitter sirens from
anywhere.

ALERT AND ALARM ACTIVATION SOFTWARE - SEV-ALERT

Features

The SEV-ALERT software implements the control and monitoring of SEV Squitter sirens on desktops and servers, allowing intuitive remote access to the sirens for activation, message selection, testing, and status verification.

The system can be configured to regularly test and check sirens' operational status, visually indicating their current status on a pop-up window (off-line, activated, critical fault, non-critical fault, command pending, etc.).

SEV-ALERT allows the administrator to add or remove devices and users and define the hierarchical structure of siren network groups.

Data from external sensors, such as rain gauges, can be integrated to the same platform. Every data received will be stored in the data base and will be available to the user in real time (on demand).

Highlights

- Control and monitoring for Squitter SEV line sirens
- Map or list view
- Individual or group activation
- Operational statistics
- Event log storage
- Automatic verification of siren operational status.
