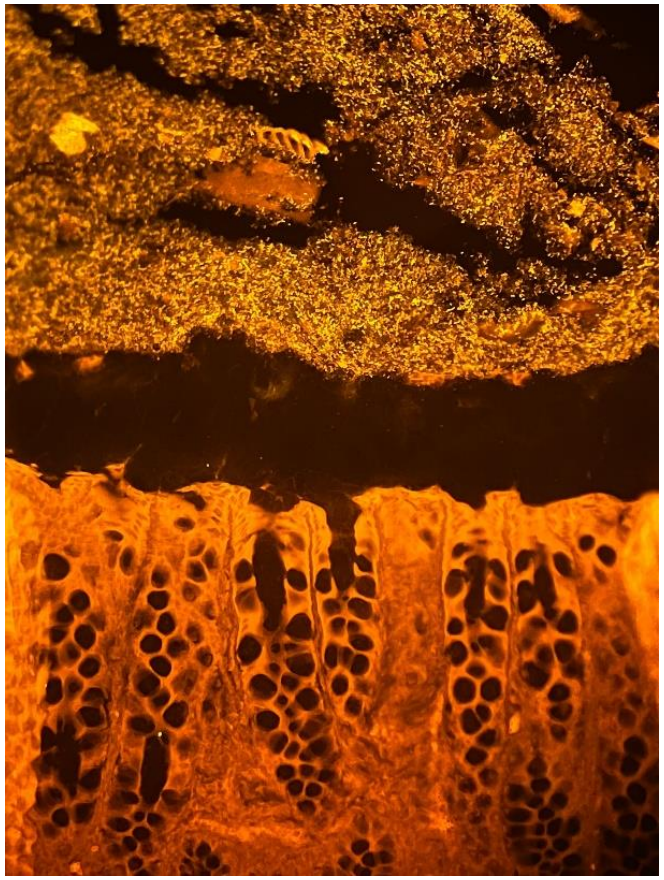
Intestinal microbiota

Courtesy of Jan Suchodolski GI LAB Texas A&M



Highly diverse and balanced ecosystem

Bacteria most represented with100 x 10^{12} microorganisms from >1000 species

Metabolic function

Beneficial metabolites

Short chain fatty acids (SCFA) – from dietary NFE/fiber

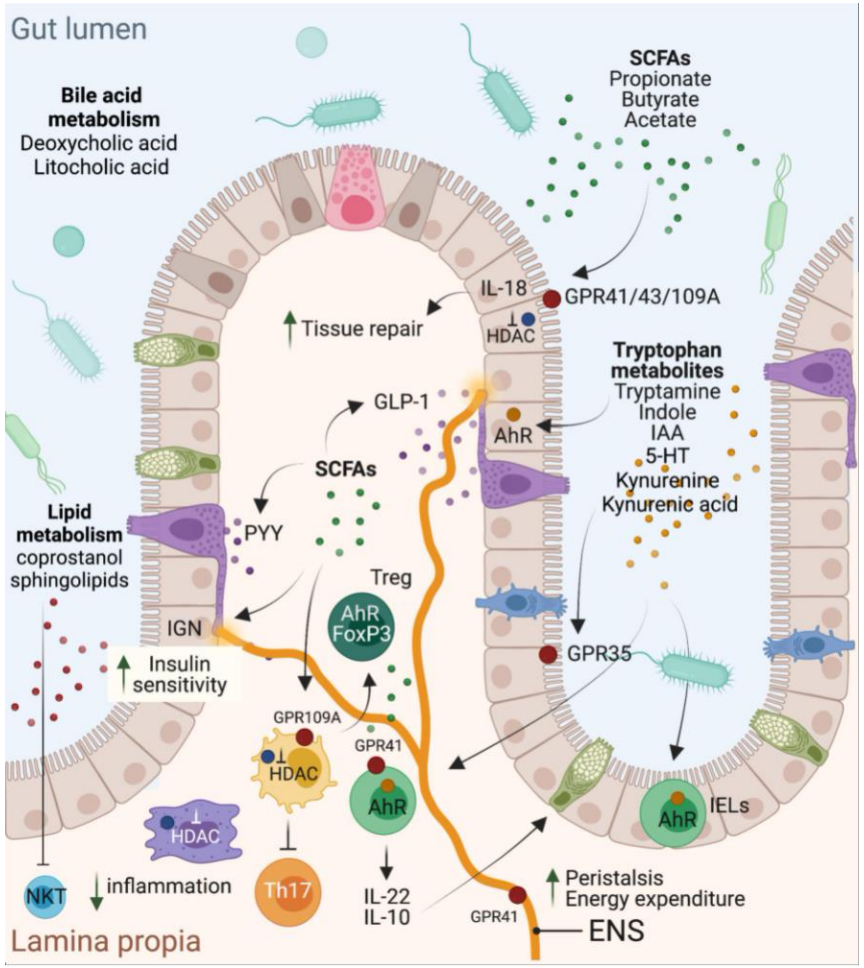
Faecalibacterium prausnitzii & others

Tryptophan + lipid metabolites (indole, kynurenine and kynurenic acid, sphingolipids)

Many bacterial species

Secondary bile acids (SBA) – from primary bile acids

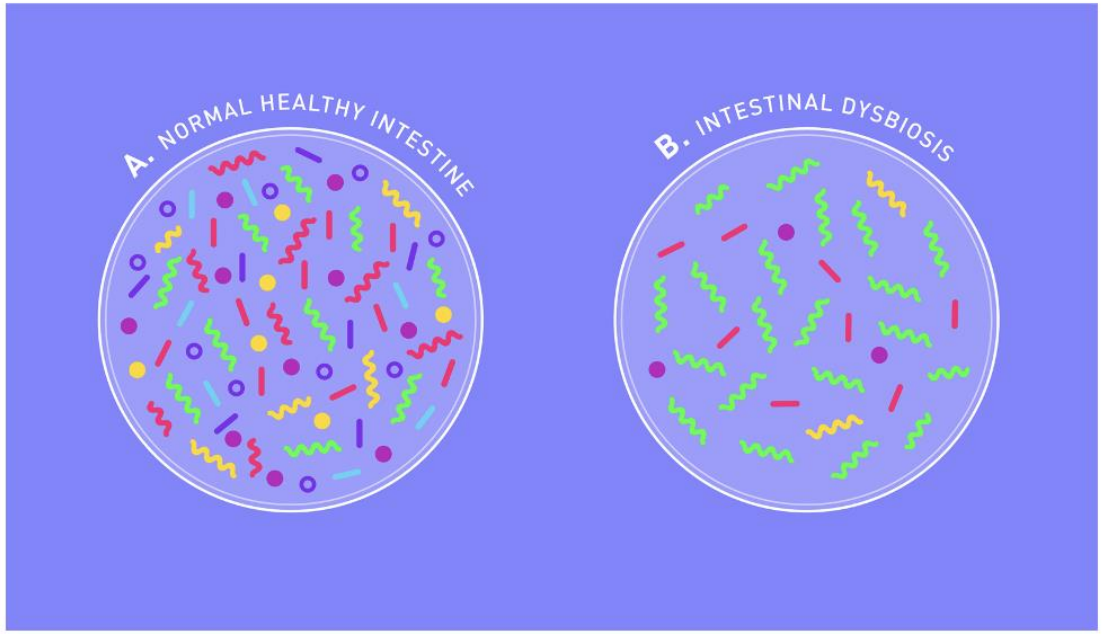
Clostridium (Peptacetobacter) hiranonis (dogs & cats)



Tudela H, Claus SP, Saleh M. Front Cell Dev Biol. 2021;9:719072

Intestinal dysbiosis

Changes in composition and/or function of the intestinal microbiota



DeGruttola AK, et al. Inflamm Bowel Dis. 2016 May;22(5):1137-50

Disruptors of GI homeostasis

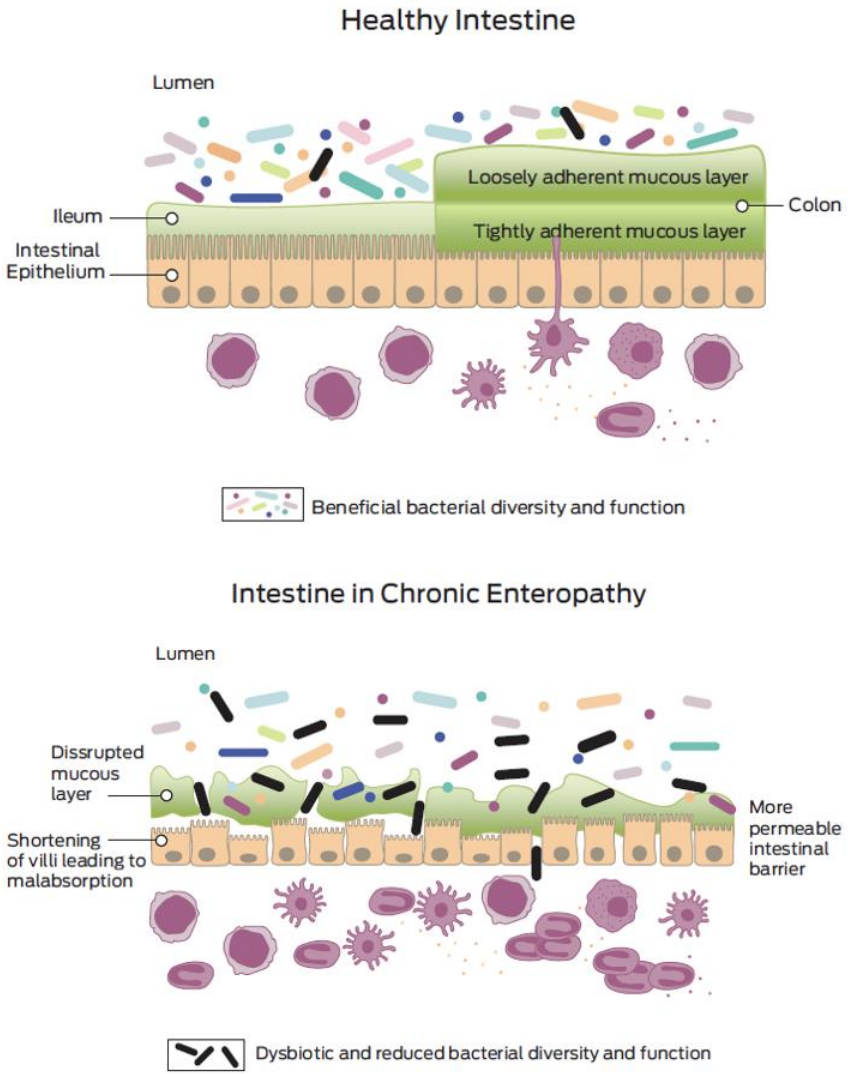
Poor quality and/or imbalanced diet*

Enteropathogens (CPV, FPV, FeCV)*

Antimicrobials*, NSAIDs, PPIs

Inflammation

especially early in life*



Suchodolski JS - In “Purina Institute - Canine and Feline Clinical Nutrition Handbook, 2023 edition”

Sung CH, et al. Animals (Basel). 2023 Aug 11;13(16):2597.

Potential uses of fecal DI

Identifying sub-clinical dysbiosis in patients at risk

Identifying persistent antibiotic-induced dysbiosis

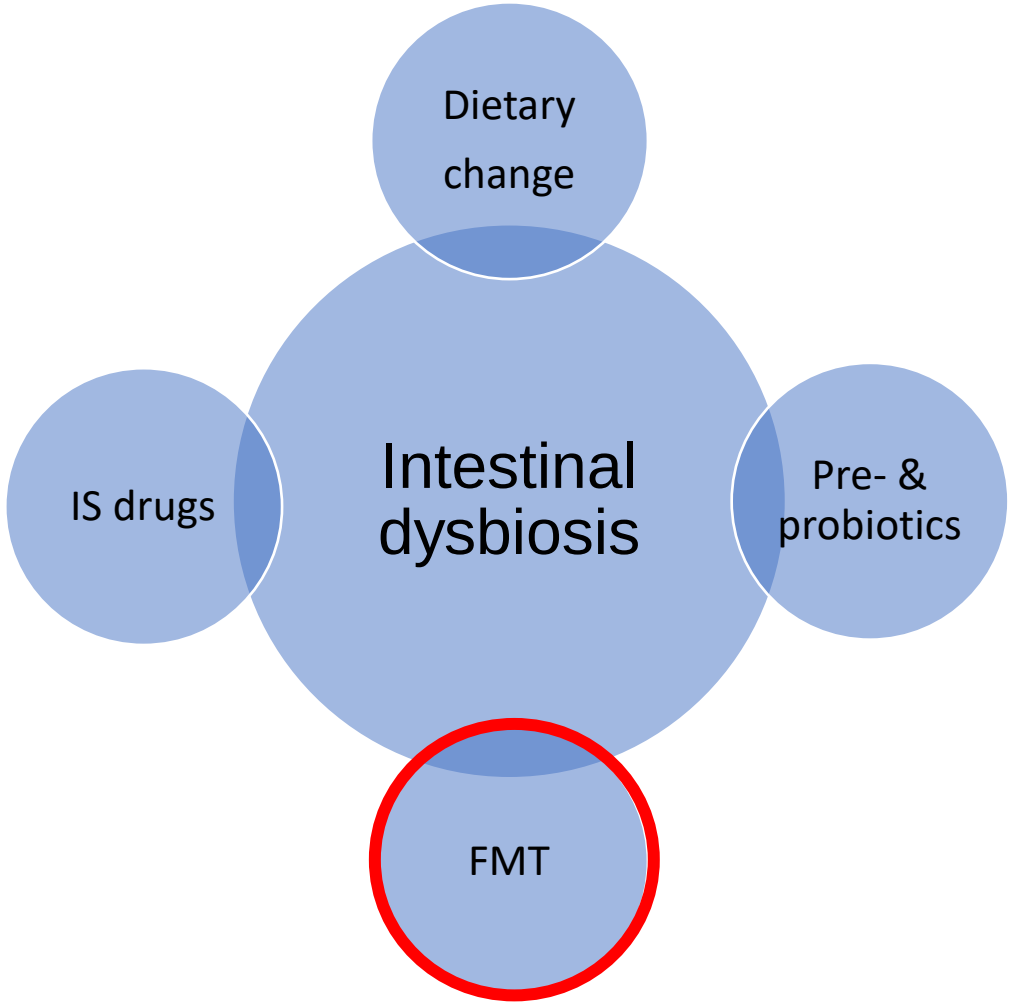
Based on severity and pattern (i.e. loss of *P. hiranonis*)

- Increase likelihood of chronic enteropathy in patient with recurrent/acute on chronic GI signs (especially cats)

Predict long-term response to FMT

Screen for healthy fecal donors

Managing intestinal dysbiosis



Choice of strategy will depend on type/cause, duration and severity of dysbiosis

Multimodal versus sequential approach

Target (clinical remission versus cure) will depend on cause of dysbiosis

Treatment option	Mechanisms of action	Potential limitations
Diet	• Improved digestibility - less substrates for bacterial growth • Reduced immunogenicity	• Palatability, cost
Prebiotics/fibers	• Stimulates growth of beneficial bacteria • Binds toxic metabolites	• Excess might cause clinical signs
Probiotics	• Improve barrier function • Immunomodulation	• Minimal effect on total microbiota composition
Antibiotics	• Reduction in total and mucosa-adherent bacteria • Reduced toxic metabolites	• Negative impact on microbiota diversity and beneficial species • GI toxicity • Limited effect in the long term • Antimicrobial resistance
Fecal microbiota transplantation	• Modification of luminal microbiota and metabolites • Reduction of enteropathogens	• Minimal effect on mucosal adherent microbiota • Limited duration of effect if underlying intestinal inflammation still present

Fecal microbiota transplantation (FMT)

Infusion of **fecal matter** from a healthy donor into the gastrointestinal tract of a patient (to introduce or re-establish a stable microbial community) in order *to treat a dysbiosis-related disease*

Super poo: the emerging science of stool transplants and designer gut bacteria

Rawf8/Getty Images/iStockphoto

Major indication in people

Recurrent *Clostridiodes difficile infection* (CDI)

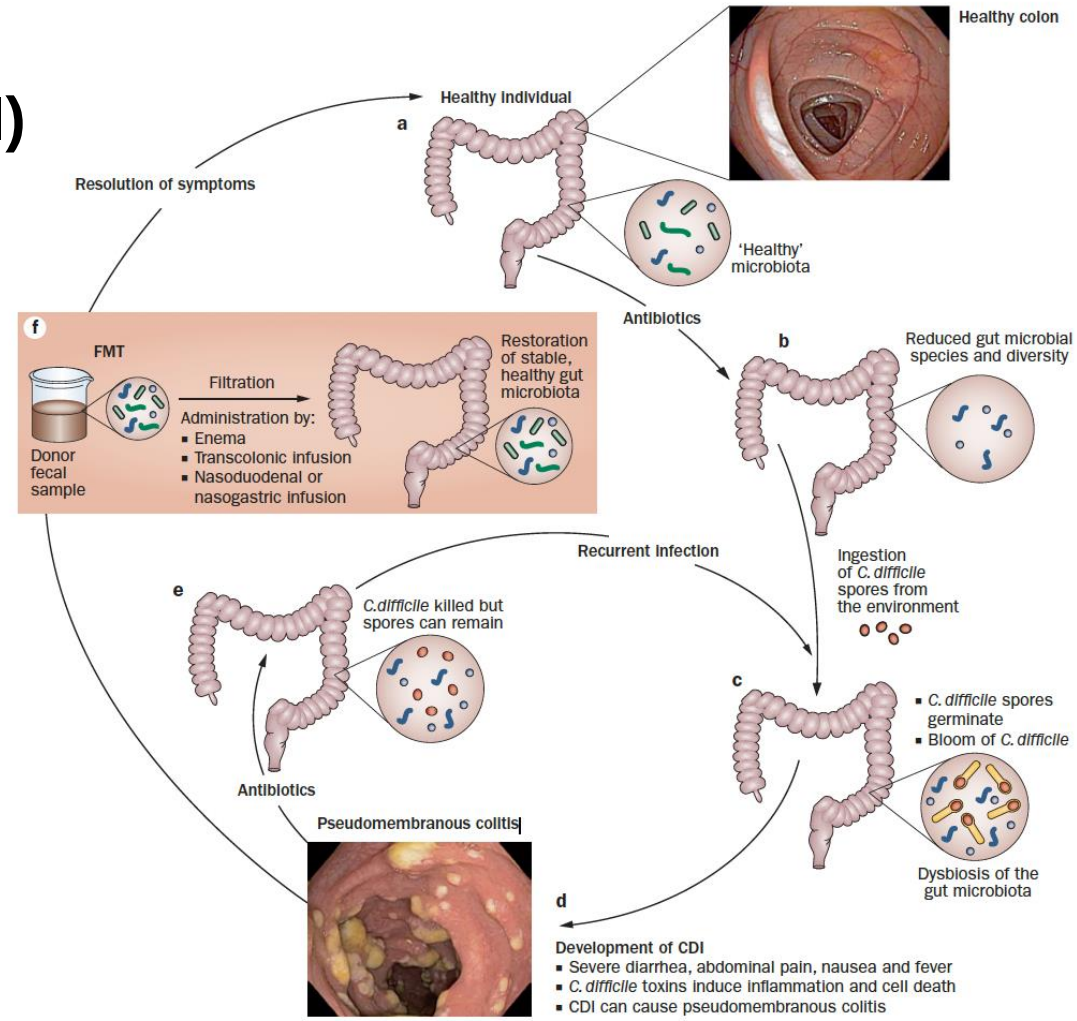
Acquired after antibiotic use + ingestion of environmental *CD* spores

Risk of relapse 20%
Chronic long-lasting CDI (antibiotic refractory)

Annual burden > 80,000$/patient

FMT therapeutic success rates > 90%

Very high safety profile



Borody TJ et al, Nat Rev Gastroenterol Hepatol. 2011: 20;9(2):88-96

Fecal microbiota transplantation in gastrointestinal and extraintestinal disorders

Gianluca Ianiro*[,1], Jonathan P Segal[2], Benjamin H Mullish[3], Mohammed N Quraishi[4,5], Serena Porcari[1], Ginevra Fabiani[1], Antonio Gasbarrini[1] & Giovanni Cammarota[1]

Efficacy of FMT in dogs and cats

Infectious diarrhea (*Parvovirus)* - dogs

Acute uncomplicated diarrhoea – dogs

Antibiotic-induced dysbiosis and diarrhoea – dogs, cats

Chronic GI signs refractory to diet/fibre - dogs, cats

SRE and NRE as adjunctive therapy (multimodal therapy) – dogs, cats

Retrospective
Under-powered
Uncontrolled studies
Clinical experience

Canine parvoviral enteritis

Pereira et al, 2018

66 puppies with CPVI

33 STD vs 33 STD + FMT

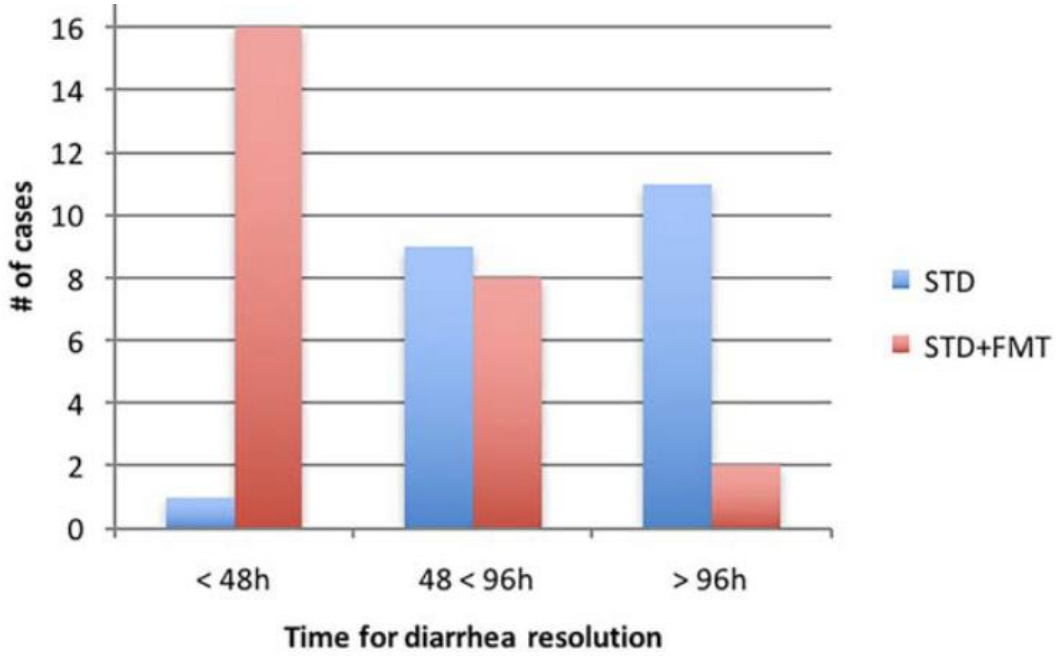
Faster resolution of diarrhoea in FMT

Shorter hospitalisation time

3 vs 6 days

No statistical difference in survival rates

For FMT, 10 g of feces from a healthy dog diluted in10 mL of saline were administered rectally 6-12 hours post-admission



Pereira GQ, et al. J Vet Intern Med. 2018 Mar;32(2):707-711

Canine chronic enteropathy (CE)

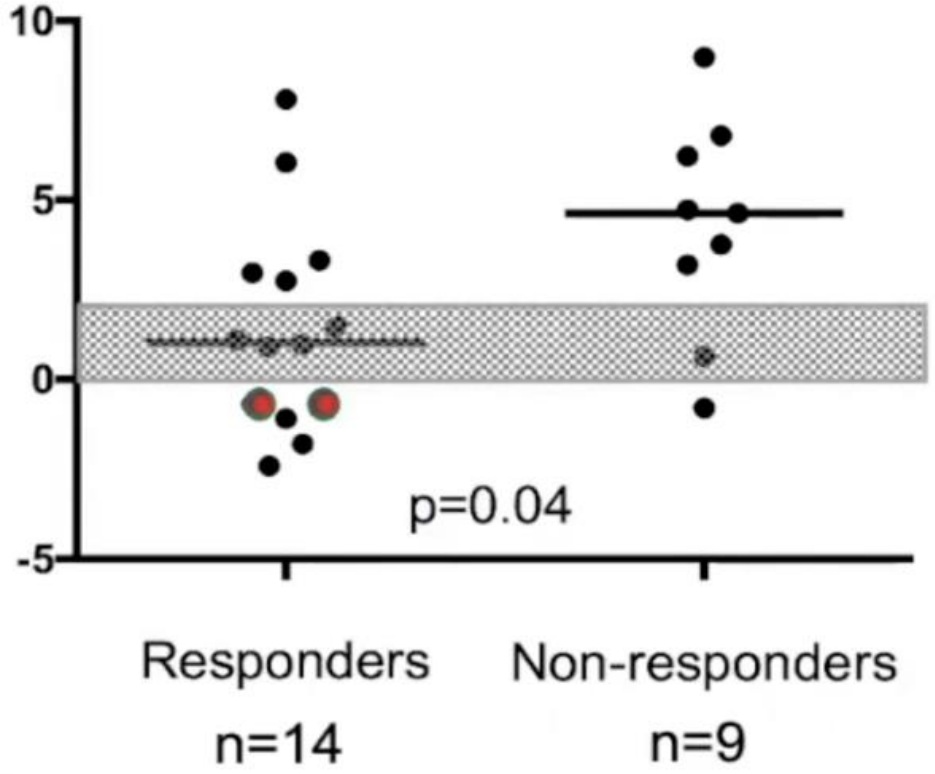
Toresson et al, 2022

Retrospective study
41 dogs with SRE

Treated via – retention enema
Median 3 FMTs 14 days apart

72% of dogs showed satisfactory clinical response

Degree of dysbiosis (DI) associated with response to FMT



Toresson L, et al. *Veterinary Sciences*. 2023; 10(4):271

Canine food refractory CE

Preparation

Fresh (within 2-6 hours from voiding)

Fresh-frozen (processed as soon as possible after voiding

- can be kept refrigerated at 4°C for up to 2 days before)

Addition of cryopreservant before freezing (glycerol 1:10)

Processing can be done in aerobic environment

My method

2.5-5 gr feces /kg b.w. of recipient

Blend in 1:1 or 1:2 with 0.9% NaCl solution by hand in a zip bag

Filtered on fine kitchen sieve

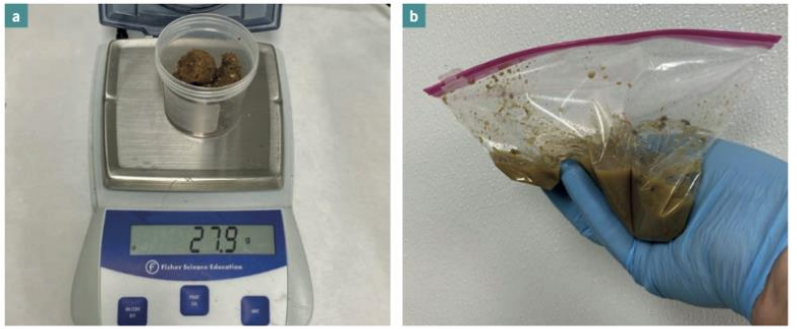
Freeze after adding glycerol 1:10 for later use

Administer after thawing with 20-60 cc syringe through wide bore soft rectal catheter (12 Fr)

With or without sedation (usually needed in cats)

No food and no walk for 4-6 hours (dogs)

Keep in hospital for 4-6 hours (cats)



Repeat 1-2 weeks apart

Some real life case examples

Meet Chloe

5 yrs old FN Maltese cross

Refractory/non-responsive chronic enteropathy

Life long intermittent GI signs
Continuously over last 2 months

Previously:
Fiber enriched diet & novel protein diet trials
Metronidazole

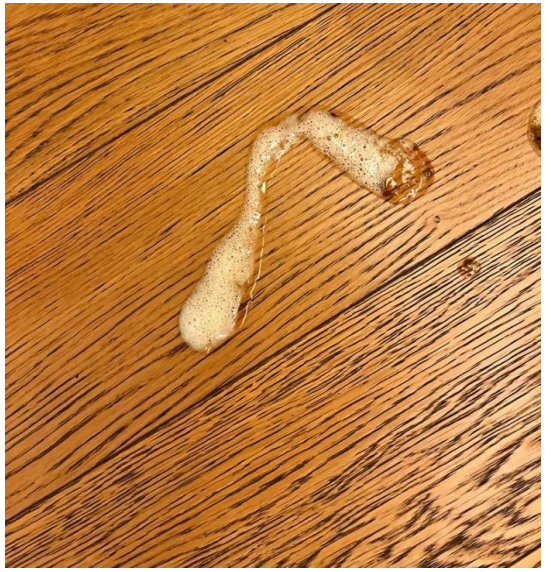
Advised endoscopy for GI biopsies and glucocorticoids trial

At the time of presentation

Daily vomiting (mostly bilious)
Liquid feces with frank blood and mucus (PFS 5-7/7)
& tenesmus

Nocturnal swallowing fits
Selective appetite
Fed on chicken or pork based home cooked diet

Stable weight, BCS 5/9



Diagnostic and clinical staging

Severe clinical disease activity (CIBDAI score 9)

Fecal flotation - negative

CBC - mild eosinophilia
Serum biochem - Mild ALT and DGGR lipase activities increase
cTLI and basal cortisol ruled out EPI and HypoA

Serum cobalamin < 150 ng/L

Abdominal ultrasound: indicative of non-specific mild chronic enteropathy

Initial treatment strategy

Awaiting - fecal DI

Eliminate all extras from daily diet

Hydrolysed soy diet

Multistrain high dose probiotic

Oral cobalamin 0.5 mg PO q 24 hours

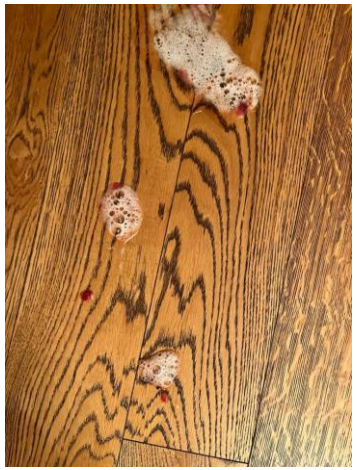
Two weeks follow-up

Partial response

CIBDAI 3

Purina fecal score 3/7

Occasional bilious vomiting + colitis



Fecal DI

Post FMT follow-up

Complete remission

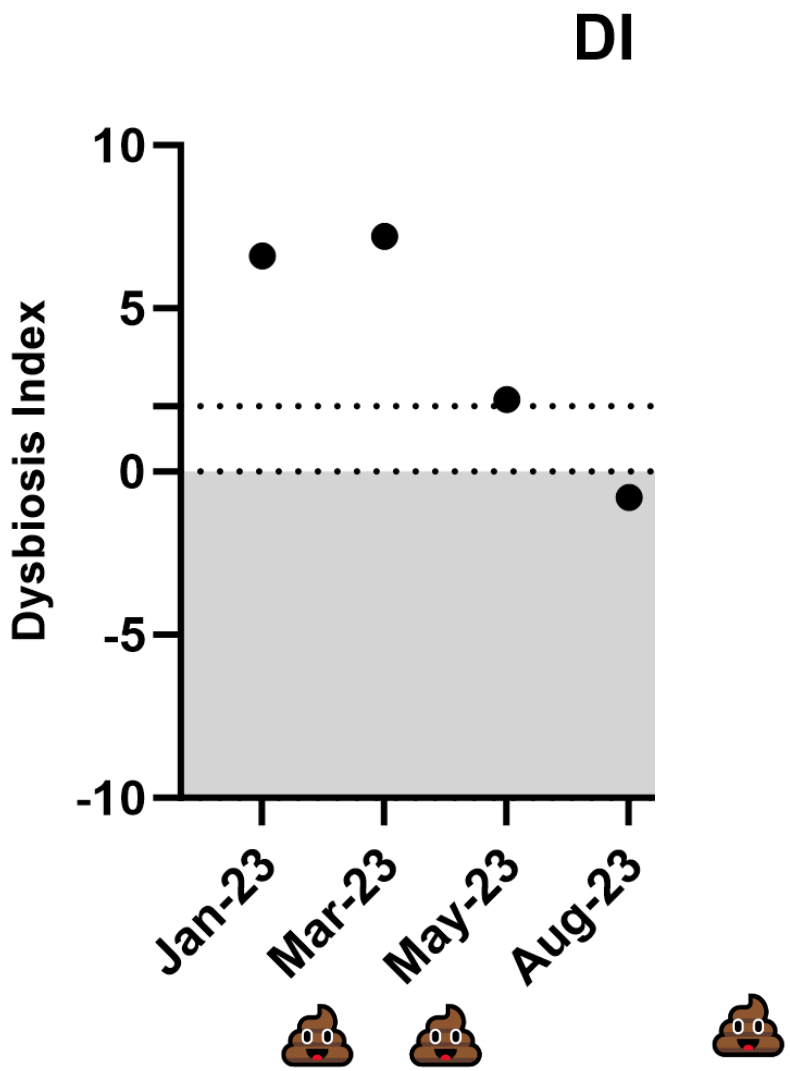
CIBDAI 0

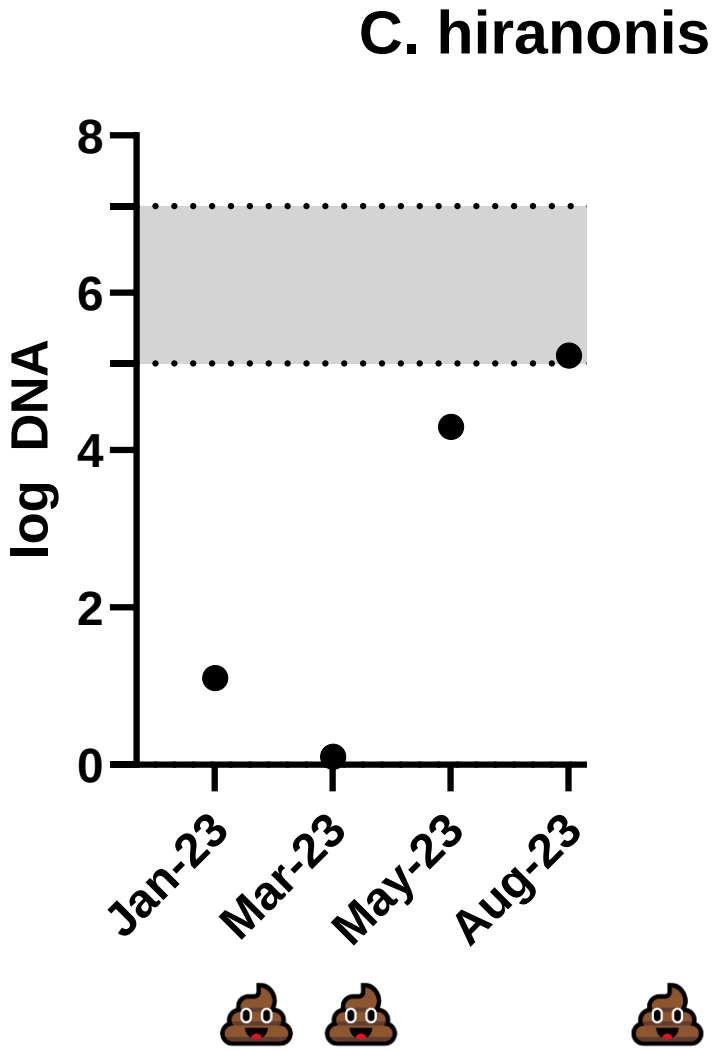
Purina fecal score 2/7

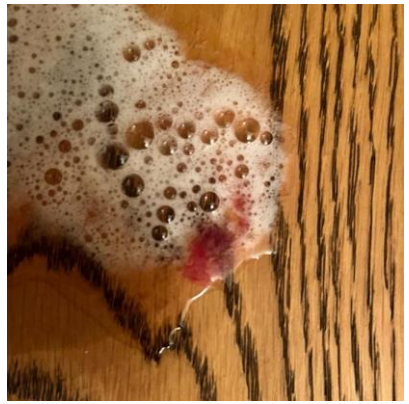
Weight gain

No more vomiting episodes

Follow-up DIs







Skoll

3 yrs old ME Alaskan Malamute

Referred for refractory chronic mixed bowel diarrhoea – 3 months duration

Failed hydrolysed (soy) + single protein (horse) home cooked diets trials

Gastroduodenal-colonoscopy + H&E: mild to moderate lymphoplasmacytic enterocolitis

Minimal response to glucocorticoids + probiotics (still receiving)

At the time of presentation

Severe mixed bowel diarrhoea (FS 7/7)
Hematochezia + mucus
Increased number of defecation

Dysorexia
Rare vomiting episodes

Weight and muscle loss
BCS 4/9

Polyuria, polydipsia, poor exercise tolerance

Staging

Severe clinical disease activity (CIBDAI score 11)

CBC: within normal limits

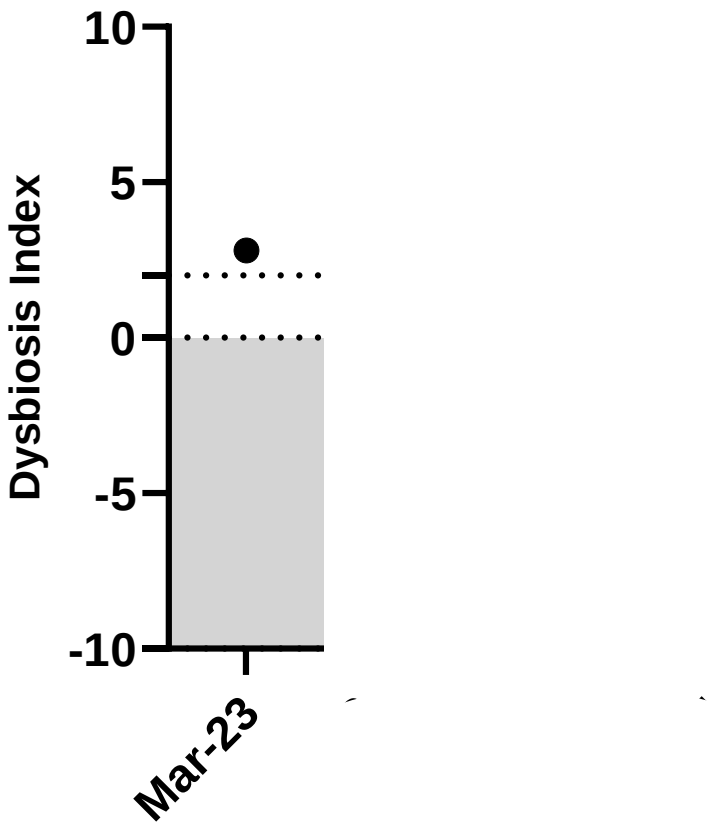
Biochemistry: moderate ALT and ALP increase, marked DGGR lipase increase, mild CRP increase

cTLI: 33 ug/L
Serum cobalamin: 588 ng/L

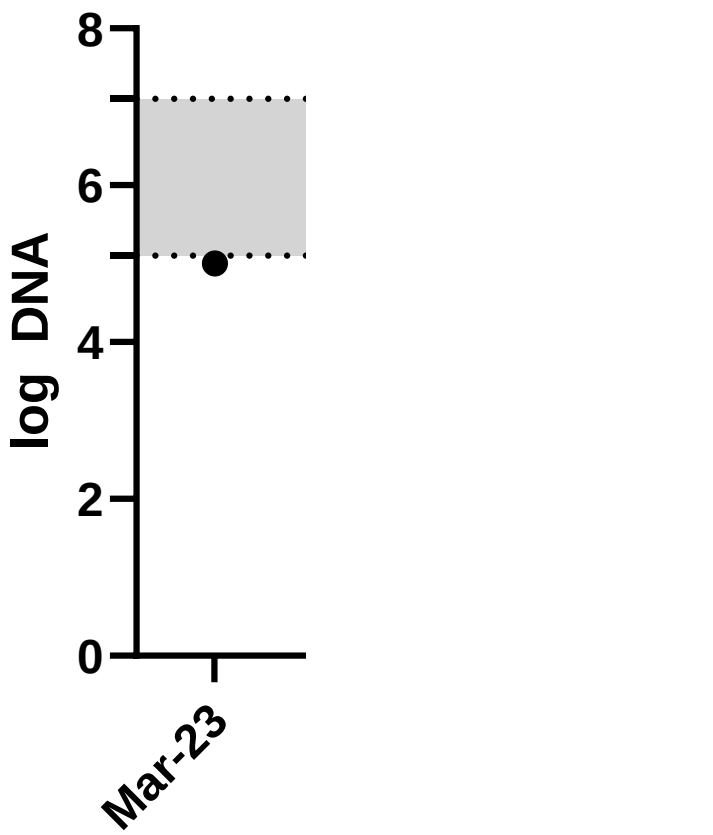
Abdominal ultrasonography: small sized adrenal glands, vacuolar (steroid) hepatopathy, mild chronic enteropathy

Baseline DI

DI



C. hiranonis



Initial treatment plan

Highly digestible low residue fiber enriched diet

Taper down glucocorticoids

Continue high dose multistrain probiotic

Follow-up

Off glucocorticoids

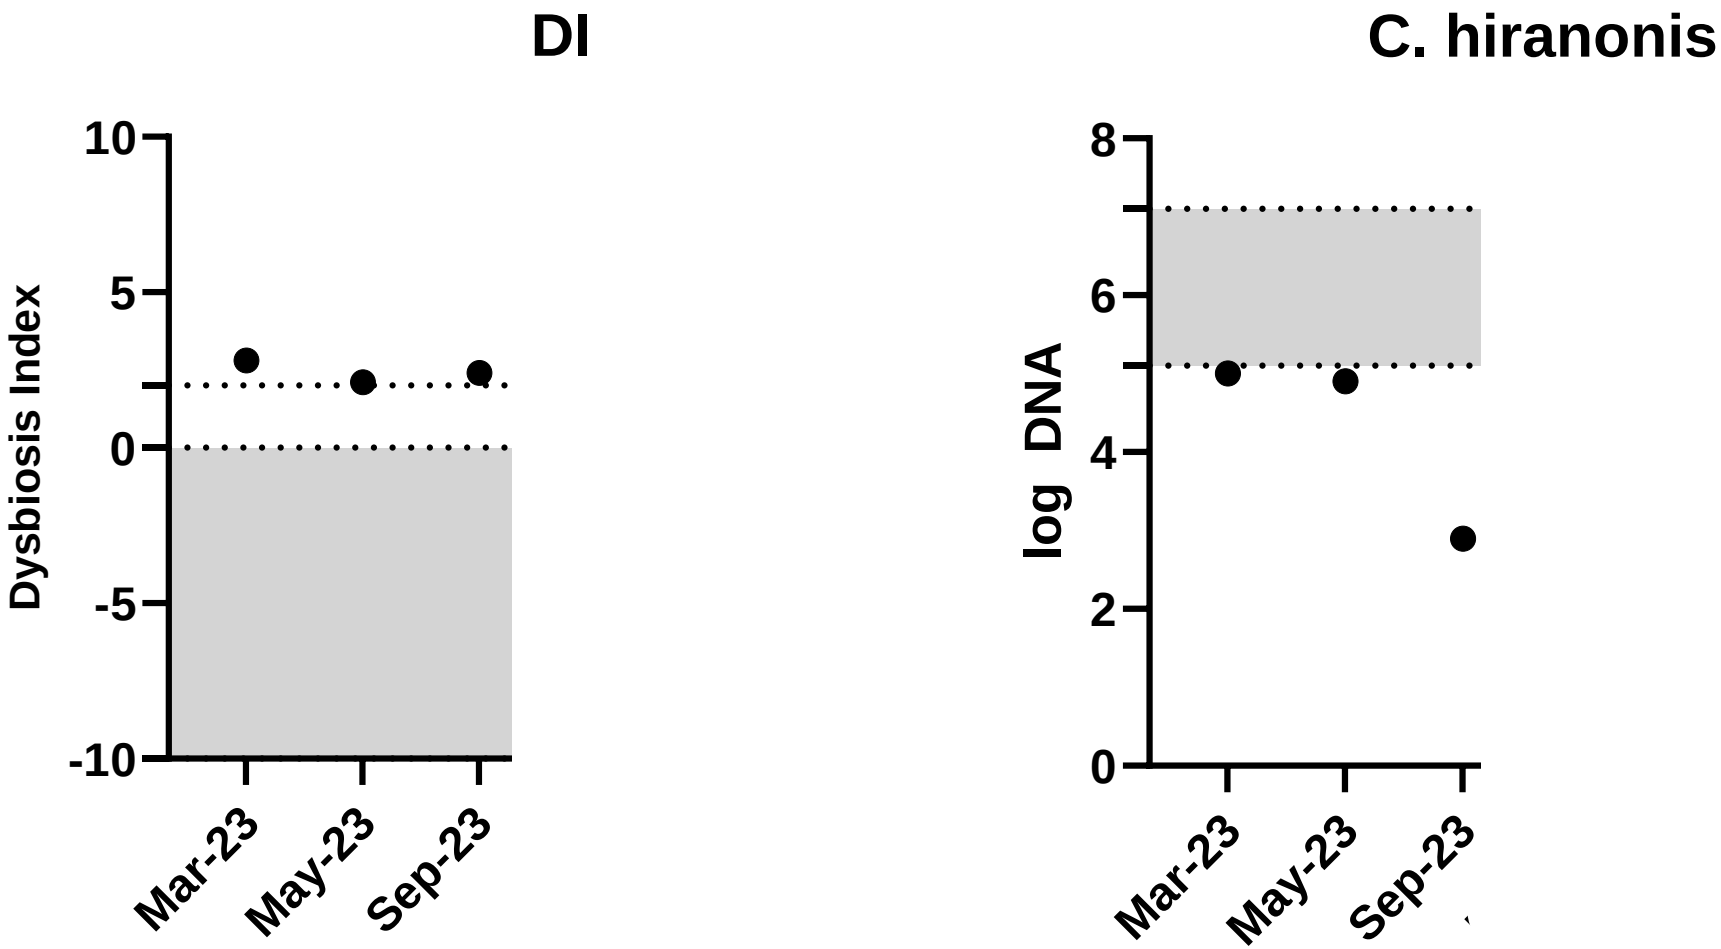
CIBDAI 5 (mild disease activity)

FS 5/7
Occasional hematochezia and mucus
Frequency of defecation reduced

Improved appetite and exercise tolerance
Weight gain

PU/PD only mild

Follow-up DIs



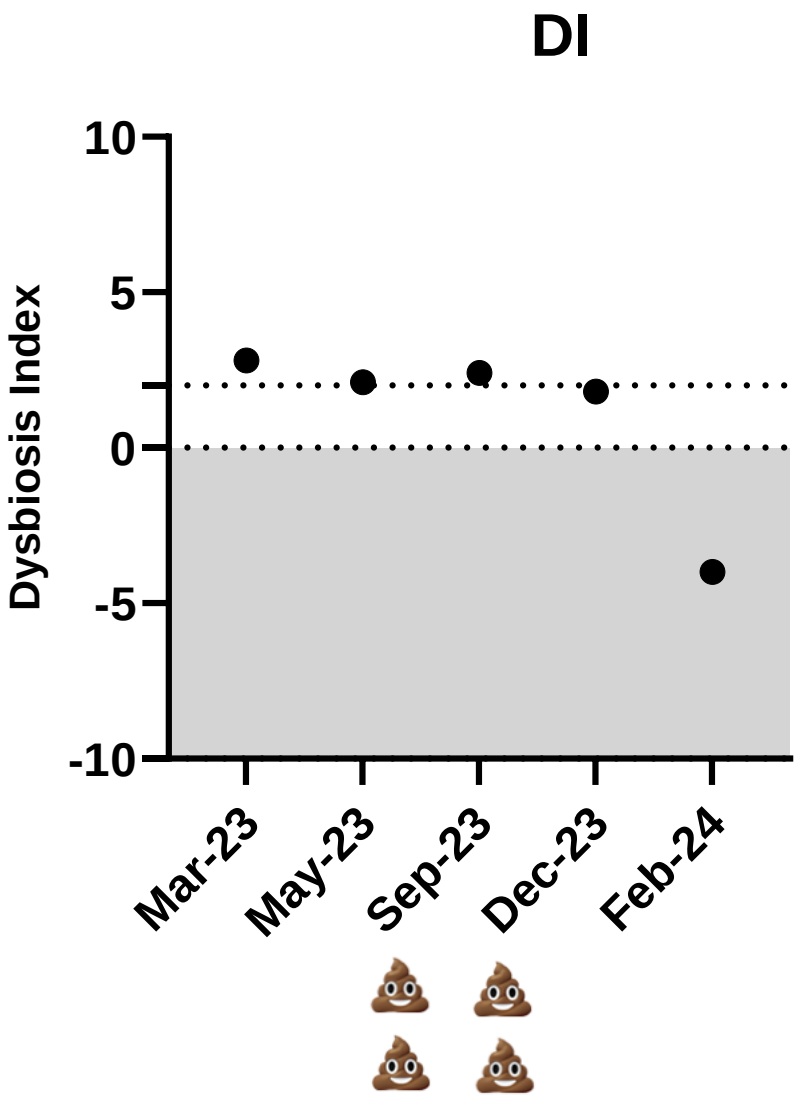
After FMT

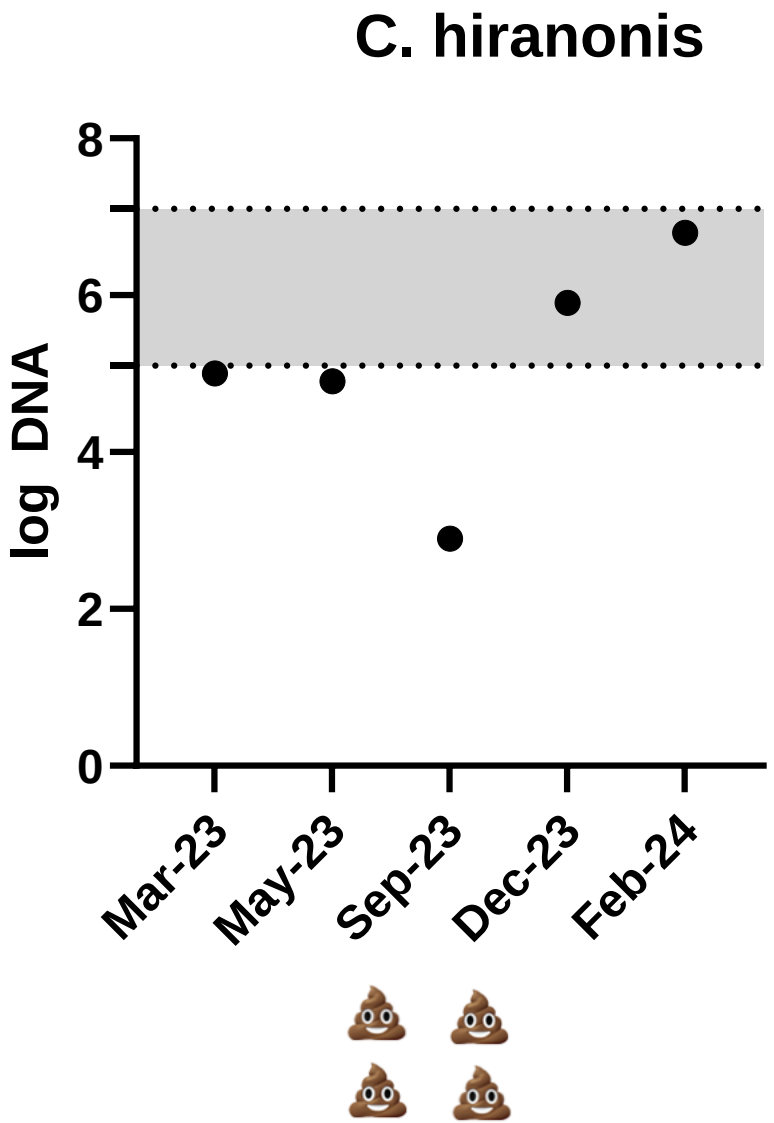
Off glucocorticoids

CIBDAI 0
FS 2-3/7
No other clinical signs

Excellent appetite
2 kg body weight increase
PU/PD resolved

Follow-up DIs





Lupin

2 yrs old MN DSH

Chronic small intestinal diarrhea, 2-3 times a day

No identifiable cause

Refractory to fiber enriched-, highly digestible, hydrolyzed diets and probiotics

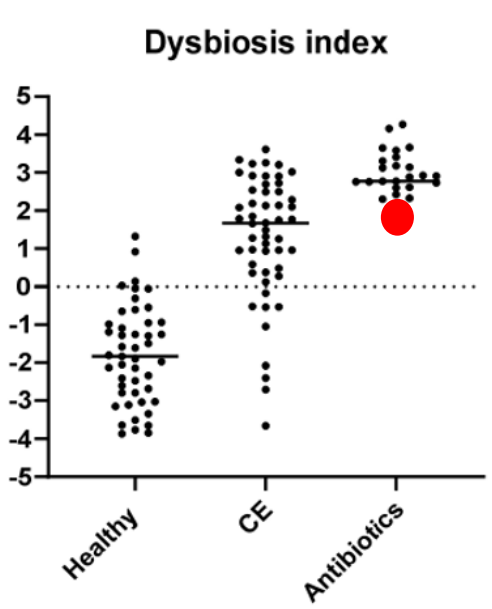
Responsive to amoxicillin clavulanate

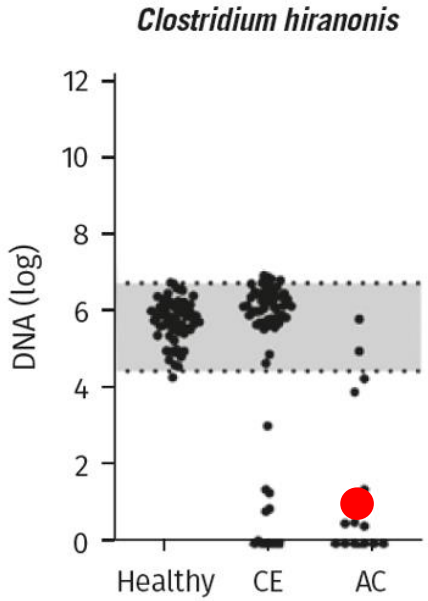
Gradual return to liquid stools when discontinued

Lost responsiveness with time

Fecal DI – 1 month off antibiotics

DI	2.2	< 0
Clostridium hiranonis	**0.8**	4.5-7.1
Bacteroides	5.9	4.0-7.5
Bifidobacterium	6.2	3.2-8.7
Turicibacter	4.8	4.4-9.0
Faecalibacterium	3.9	3.8-8.4
Streptococcus	2.8	1.6-5.2
E. coli	3.9	1.4-7.0





https://vetmed.tamu.edu/gilab/

1 + 4 weeks post FMT

Pre- and post-FMT Dysbiosis index

DI	2.2	0.8	< 0
Clostridium hiranonis	0.8	4,4	4.5-7.1
Bacteroides	5.9	5.3	4.0-7.5
Bifidobacterium	6.2	7.1	3.2-8.7
Turicibacter	4.8	6.4	4.4-9.0
Faecalibacterium	3.9	4.0	3.8-8.4
Streptococcus	2.8	2.2	1.6-5.2
E. coli	3.9	5.4	1.4-7.0

Take home messages

Treatment strategies for intestinal dysbiosis should depend on the underlying cause and will often require a multimodal approach

Cure is possible in mild cases (provided the eliciting cause is eliminated) or in antibiotic-induced dysbiosis (as sole treatment)

Clinical remission is a reasonable target in CE-associated dysbiosis (multimodal strategy)

Based on current available evidence, a dietary trial should be attempted first in dogs and cats with chronic GI signs and should always be part of multimodal treatment strategies

Take home messages

Besides inducing antimicrobial resistance, antibiotics are detrimental to gut and microbiome health

They should not be routinely used for the diagnostic approach and treatment of GI signs

FMT appears to be efficacious especially in young dogs and cats with mild dysbiosis or antibiotic-induced dysbiosis and associated GI signs

The use of FMT in CE appears promising for clinical remission, especially in the context of a multimodal approach

Thank you very much for the attention!
