HOW IT WORKS

When an insect bites or stings, proteins in its saliva or venom trigger histamine release, causing itching, pain, and swelling. Applying brief, concentrated heat helps by:

- Denaturing venom proteins, reducing their activity
- Activating TRPV1 receptors to suppress itch
- Boosting blood flow to clear inflammation

Studies show that controlled noxious heat can inhibit histamine- and non-histamine-induced itch (Yosipovitch et al., 2005; Riccio et al., 2019).

- 1 Clean bite area and remove any stinger.

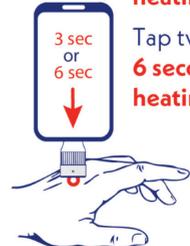

- 2 Remove device from holder and plug into phone's USB-C port.

- 3 Tap once
3 second heating

Tap twice
6 second heating

CLINICALLY PROVEN RESULTS

In a large German study involving over 1,750 participants and 12,000 insect bite treatments, concentrated heat significantly reduced itch and pain:

- **MOSQUITO BITES:** up to 81% itch relief within 10 minutes
- **HORSEFLY BITES:** up to 89% itch relief within 10 minutes
- **BEE/WASP STINGS:** up to 64% itch relief within 10 minutes
- **PAIN:** up to 80% reduction within 10 minutes

These results were significantly better than the control group receiving no heat treatment (Metz et al., 2023).
