

Push & Dose

A ground-breaking innovation for perfect sprinkling

Push & Dose is a new and revolutionary dosing invention for the consumer market. The innovation sits inside of the flexible packaging and consists of an elastic membrane between springy plates. This gives a perfect sprinkling of powder and granular products like spices, food products (e.g. Milk powder, Cheese powder, Cake decorations), medical products, cosmetic products and for special products.

Push & Dose is also an economical solution because of low material-, production- and transportation costs. Furthermore, it creates less garbage which is environmentally friendly.

How to use it:

1. Tear (easy to open)
2. Turn
3. Squeeze
4. Release

We at HDG offer a P&D applicator model for our RB-200 machine. The machine is a compact, horizontal forming, filling and sealing machine with a rotary table system for side sealed pouches. It is a part of the HDG premium line which is distinguished by both a high capacity and maximum flexibility.

Have a look at the fantastic video on LinkedIn about P&D
