Expand your view with open mesh

Sefar has enlarged its SEFAR® PME screen printing mesh range with products featuring a larger open area. These new meshes will be shown at FESPA 2022 on the Sefar booth in hall 27 booth no. B29.

The new Sefar Open Mesh fabrics are

- SEFAR® PME 59/150-48Y PW
- SEFAR® PME 75/190-40W/Y PW

These mesh types are mainly used with water based ink systems where high ink volume and homogeneous ink coverage are required. The larger open mesh area also reduces ink drying in the meshes of the stencil.

It has been reflected by the market that with the new SEFAR® PME open mesh, screen printing process gets much more stable over longer runs, i.e. more prints can be made until the stencil needs to be cleaned. These results are achieved thanks to the mesh construction with finer Sefar yarn (less threads, thinner fabric). The outstanding characteristic SEFAR® PME properties remain intact. The mesh surface is treated with the latest technologies to achieve good emulsion adhesion and very good ink release, which in turn leads to excellent printing results.

The Sefar Screen Printing Team is looking forward to your visit at FESPA 2022 booth no. B29 in hall 27.
