

Meridian
By Correla

Connecting people with data

Meridian **connects** you
to the **bilateral flow**
of data across the
energy industry.

Meridian facilitates the consistent and accurate flow of real-time data between systems and market participants into a single secure environment. It integrates easily with existing systems, accelerates the movement of data and creates cost efficiencies through its cloud functionality.

The energy market in the UK is one of the most demanding in the world. The pace of technology advancement, rising customer expectations and the sheer volume of data is a constant challenge to access and manage.

That's where we come in.

Meridian by Correla is our SaaS platform that facilitates the movement and flow of data throughout the energy sector between systems, data points and market participants.

It translates data so that it can seamlessly flow between systems, eradicating data gaps and bridging the divide between legacy systems which allows organisations to sweat existing system assets by acting as a data transfer intermediary.

Meridian delivers complete interoperability across the energy eco-system via an open framework to foster future innovation and rapid expansion. We like to think of it as the "internet for energy" – being the single point of reference for customers to receive real-time, personalised, consistent data on a self-service basis.

The single reference point for multiple data sources

Meridian has been designed to address some of the most common customer pain points when it comes to managing the movement of data, access and validation. The Meridian platform is the foundation of multiple products that can transform how businesses use data to improve efficiency and simplify critical processes.

One central platform

Connecting participants to the constant flow of data – delivering secure, real-time and batch integration between devices, systems and businesses.

Greater control and tracking

Data validation and file flow traceability puts users in control of all of their data exchanges via a single, intuitive user interface.

Reduced risk and reliance

Reduces reliance on 3rd parties enabling the optimisation of in-house skills and capabilities.

Lower cost to serve

Reduces total cost of ownership (TCO) through the consolidation of multiple technologies into one platform.

Strategic functionality

With our Meridian platform as the foundation, we develop products in direct response to customer demands.

SwitchStream is one example. It's a flexible, smart and transparent adapter service, developed to help energy industry participants align to Ofgem's Centralised Switching Service (CSS). It's designed to make these changes simpler for customers. SwitchStream serves 30% of the entire gas industry of the UK.

While every business faces unique challenges, some are reported time and time again. Our platforms are built on that real-world understanding and the products we create deliver genuine benefits.

7 reasons to choose Meridian

- The cloud based nature of the platform reduces the risk of data breaches and GDPR fines by adopting the more secure SFTP encrypted file transfer protocol.
- Customers receive faster query resolution through direct operational support capabilities.
- Deploying Meridian removes the need for bulky on-site equipment and internal data centres freeing up valuable operational resource and removing potentially large cost overheads.
- Peace of mind that your data is fully backed up so that data cannot be lost and data flows can proceed uninterrupted.
- Users will benefit from extended audit and data logs which will allow them to fully track and understand their file traffic with absolute clarity.
- Faster access allows users greater agility to react to market conditions.
- Remove the risk of system outages – our SLA specifies a 99.9% uptime.

The Correla approach

Powering change is the big idea that underpins our mission to transform the energy market into a simpler, greener place to be.

We find empowering solutions to complex data problems. Our platforms are totally adaptable, reacting to market needs and customer requirements, often ahead of the game.

This leads to all participants being more agile, finding cost efficiencies and delivering a fantastic service for their customers and consumers generally.

Our products and services support customers to:

- + Meet net zero obligations by 2050
- + Drive for renewable energy sources
- + Ofgem requirement for faster switching
- + Smart meter roll out
- + Energy code evolution
