# Waypoint <mark>connects</mark> disparate systems, <mark>validates</mark> data and <mark>streamlines</mark> asset rollout.

**Waypoint is the configurable SaaS platform by Correla that enables asset deployment and automates complex multi-party workflows for the whole energy market. It allows simplified ongoing management of your in-field workforce and live assets.**

The metering assets and platforms used to measure and report energy consumption are central to the flow of data around the market. When performing, they can bring significant benefits such as cost savings, energy efficiency, and improved accuracy. However, connecting meters to the wider infrastructure and the installation process itself can be a complex and challenging process.

**That's where we come in.**

We are trusted by some of the biggest names in the sector to source, interpret, process and communicate the energy industries' most critical data.
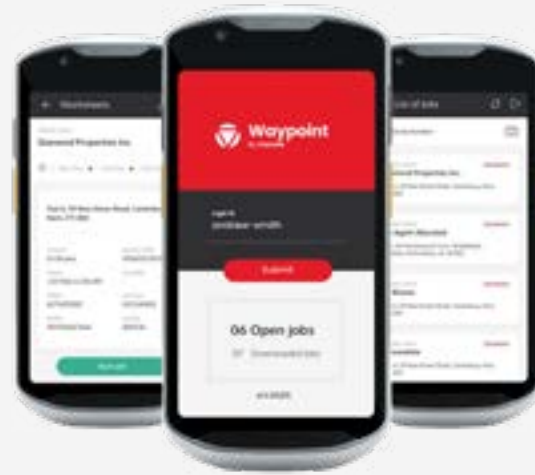

Our Waypoint platform enables precise asset tracking, guides installation and builds manageable workflows. Initially created for the gas and electric markets, Waypoint can bring cost efficiencies and agility to all emerging energy opportunities such as EV, solar or hydrogen.

The complexity of the energy market is well known but our technology removes barriers, streamlines analysis and allows all market participants the opportunity to discover efficiencies. Here at Correla we are driven by the fact that our expertise and SaaS solutions are **powering change** for customers, consumers and the wider industry.

# One intuitive platform.
# Three essential capabilities.

The Waypoint platform consists of three key elements which work together to offer a complete end-to-end solution for commissioning, installing and ongoing management of assets. Implementing Waypoint means companies can manage their own workflows, improve their operational performance and ultimately enhance their ability to deliver reliable and consistent service to customers.

## Waypoint
## Commissioning Platform

**Waypoint can be rapidly deployed to connect disparate systems and assets for a more effective, complete management solution.**

Either through your existing field service apps integrated with our API's, or using our own native cloud based Field App, Waypoint is the most efficient way to commission SMETS2 meters via a DCC adapter.

Through a single user interface, Waypoint connects to all meter types and provides a highly flexible data model, enabling us to easily communicate with new asset types without major changes needed for the processes which look-up or communicate asset information.

The end-to-end integration means Waypoint can synchronise with every major CRM platform, bringing both scheduling capabilities and capacity management to support your operation.

It can be configured to process complex multi-party workflows, whilst validating data, automating exception handling and enabling API integrations.

## Waypoint
## Field App

**The Waypoint Field App facilitates meter commissioning, guides installers and streamlines the whole installation processes.**

The app is cloud based and powered by Amazon Web Services (AWS) so it can be quickly scaled to suit the needs of your business as well as being secure and always accessible.

The app also brings a whole host of other benefits. The Waypoint Field App is configurable to deliver a consistent user experience and maximise adaptability across industry functions.

## Waypoint
## Smart Sheets

**Smart Sheets are the smart way to manage jobs, support installers, mitigate errors and improve workflows.**

Waypoint gives users the ability to create customisable smart sheets providing detailed and tailored guidance to installers. It simplifies training, mitigates errors and therefore revisits, while reducing installation time and administration requirements.

Waypoint Smart Sheets can add a new level of control to your workflows pushing real-time notifications to alert when jobs have been started, completed or amended.

## Job Modules

Our key functions consist of the following modules:

### Jobs

**Job Management**

Complete visibility of jobs booked, allowing users to track progress and outcomes across multiple job types. Quickly configure jobs based on common booking types via APIs and job outputs.

**Scheduling**

Enable the effective management of work to engineers. Optimise the work allocation based on real time data, alert users when intervention is required and dynamically update.

**Capacity & Resource Management**

Control the amount of appointments being booked for a particular region, job type, skill group, in order to meet the needs of the business.

### Assets

**Asset Tracking**

At a high level, the Asset Tracking module is a logistics tool that enables customers to accurately track and manage their entire stock of assets across warehouses, lockers, vans and jobs. It allows accurate stock level maintenance through efficient Ordering and Returns and a reduced number of idle assets.

### Meter Point Registry

**Industry Flows**

Waypoint supports the end to end processing and management of industry flows. Offering the capability to monitor and exception handle the generation of industry flows to the relevant industry parties.

**The Correla approach**

# Powering change is the big idea that underpins our mission to transform the energy market into a simpler, greener place to be.
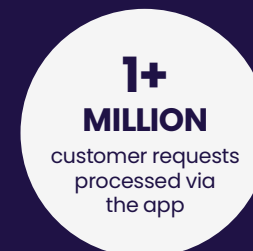

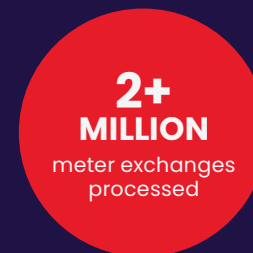

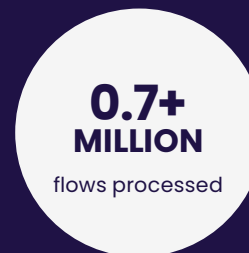

We find empowering solutions to complex data problems. Our platforms are totally adaptable, reacting to market needs and customer requirements, often ahead of the game.

This leads to all participants being more agile, finding cost efficiencies and delivering a fantastic service for their customers and consumers generally.

# No such thing as standard.

**There is nothing 'standard' about the energy market. In fact, keeping ahead of the curve has meant a constant commitment and investment into developing Waypoint into the leading platform it is today.**

For over a decade we have been evolving the platform as the requirements of the industry have changed. In that time we have evolved and updated Waypoint to be; brilliantly intuitive, infinitely scalable and totally flexible to the needs of your business.

**0.7+ MILLION**
flows processed

**2+ MILLION**
meter exchanges processed

**8 MILLION**
assets being managed

**3+ MILLION**
assets processed

**1+ MILLION**
customer requests processed via the app

**FULLY COMPLIANT**
RGMA Gas & DTM Electric Flows

**Our technologies are built around the key drivers for change:**

+ Net Zero obligation by 2050

+ Drive for renewable energy sources

+ Ofgem requirement for faster switching

+ Smart meter roll out

+ Energy code evolution
