THE TRIPOD THAT DOES MORE SO YOU CAN CARRY LESS

Introducing the Gearing Tripod System. Featuring patented magnetic technology and highly customisable elements; this really is the future of tripods.

Encompassing three key elements; outstanding materials, unprecedented modularity and tremendous durability, The Gearing Company has produced the most versatile carbon fibre tripod yet.

A magnetic connection to the ball head ensures rapid attachment to your camera, while providing faultless accuracy and stability. The innovative centre column holds a handy 10-piece screwdriver kit and features a removable ballast hook. Detach the centre column from the system to use in hand-held mode or invert it to shoot straight down for extreme close-up photography.

The modular heart unit allows you to attach different leg length options, transforming the system from a full-length to a tabletop tripod. Each carbon leg can be converted into trekking poles by attaching the handles, spikes and snow baskets included in the kit, suitable for skiing and hiking whilst exploring. In those instances where you don't have time to set up a tripod, the innovative design allows each of the legs to be used separately as monopods, to provide you with instant stability in fast-paced, fluid situations. Never expect to miss a photo opportunity while using this system.

This is the ultimate solution for the discerning photographer who enjoys adventure while travelling light. Covering a multitude of needs, this system has the capacity for adaptive change like no other.

With a ballpark figure of £1,500 for the full kit and endorsed by Leica, the tripod has already gained much attention prior to launch. The tripod will also be available to purchase on its own for use with third party heads. For more details visit [The Gearing Company website](#).
