

Press release

InFactory Solutions is now fully integrated into Testia

The team of InFactory Solutions joined the Testia family. InFactory Solutions' products and services will continue to provide high quality solutions for future industry needs - now under the Testia brand. The newly onboarded experts and solutions help customers from various industries to optimize their production processes with automated systems for composite quality control.

After already being part of the Testia group for several years, the formerly independent legal entity InFactory Solutions GmbH became part of Testia GmbH in 2024. Now, in spring 2025, the products developed by InFactory Solutions have been rebranded and integrated in the Testia portfolio. The first hands-on presentation of the rebranded products will take place at Testia's booth at JEC World 2025:

Meet Testia at JEC World 2025

4-6 March in Paris, France

Booth 6 C 43

Products dedicated to full automation and zero failure in production

The products that Testia now includes in its own portfolio help industries to take the leap towards a smart and digital production environment. This includes sensor systems like In-line Infusion Monitoring and In-line Vacuum Monitoring as well as projects that are in development like an automated stereo-vision inspection system.

[In-line Infusion Monitoring](#) - formerly known as CFF - provides a sensor system for detection and localization of resin flow-front in dry fibre manufacturing processes (RTM, LRI). It is available in two versions, empowering customers to take the step towards fully automated composite processes: PF-16 as a portable device for process development and SF-16 as an industrial embedded system.

[In-line Vacuum Monitoring](#) - previously called Leakage detector - is an in-line measurement device for leakage detection in vacuum applications, based on gas flow and pressure measurement. It offers a straightforward solution for quick and reliable bagging of composite parts.

As the name changes, the innovative mindset remains

The legal integration into Testia GmbH affects mainly the internal organization. InFactory Solutions' employees are integrated into Testia's product development department. They will continue to work at their premises in Ottobrunn, near Munich.

Holger Speckmann, managing director of Testia GmbH, welcomes the new colleagues: "Our Testia team at the Ottobrunn site and InFactory Solutions have already worked under the same roof for years. We are more than happy to welcome them in our own ranks and continue good neighbourship with good coworkership!"

With the merger, Testia again demonstrates its investment in automatization of inspection and structural integrity. Testia's products and services for structural integrity help industries to take the leap towards a smart and digital production environment.
