

Bika: design, comfort and functionality

Bika, the chair that arose from the collaboration between the design studio Ramos & Bassols and Pattio, is essentially a versatile and multi-purpose chair, with an apparently simple aesthetic, wherein the balance between contemporary design, innovation and high functionality is evident.

Movement, rhythm, life. A programme and as many contexts as conversations, sounds and ideas. Bika was created to combine life experience and to lend a versatile approach to a great number of spaces, making them richer and more unique. Every day is different, unique, authentic.

An indoor and outdoor family with the option of customising the finish in polypropylene or upholstering it, Pattio's new product is developed using an extremely resistant two-piece structure which nevertheless features a light and clean aesthetic, to ensure that space also matters. And which does so in full colour or staking all on moving it later, piling it up and changing the course of things.

The polypropylene chairs lend freshness to the space, and, thanks to their easy maintenance, they are suitable for high-turnover places such as cafeterias, conference rooms, outdoor terraces, meeting rooms, etc. Its extensive range of modern, cheerful colours can be integrated with personality in innumerable spaces.

As for the upholstered chairs, they have a structure and a shell the same as that in the polypropylene version with the novelty of a backrest lined at the front. It is a fabric with a distinctive visual effect. Horizontal stripes make up the most striking and graphic element; this is ideal for larger designs and surfaces.

Pattio's product lends an air of elegance to the various rooms, providing texture, warmth and colour. Moreover, Bika chairs are suitable for places subject to continuous movement that require order at all times such as canteens, restaurants or co-working rooms.

Pattio's approach with the Bika programme is therefore based on its structural simplicity, its soft aesthetics with harmonious shapes and its functional characteristics that ensure it can adapt to any environment.
