

CELL: The Revolution in Acoustic Design by Ideatec and Summumstudio

The Alicante-based company Ideatec, a leader in acoustic solutions, has launched CELL Modular Acoustic System in collaboration with the architectural firm Summumstudio. This innovative system optimizes sound absorption without compromising aesthetics, providing a balance between functionality and design in architectural spaces.

CELL offers two types of installation: with open louvers for greater visual permeability or with closed louvers for an opaque effect. In addition, it can be adapted in different heights and widths, providing a flexible solution for different spaces. It is made of polyester fiber, a sustainable material obtained from recycled plastic bottles, and has a wide variety of finishes to integrate into any architectural project.

This revolutionary product will be showcased at Clerkenwell Design Week, where Ideatec will be in the St James's Church Garden space, EC1R 0EA, demonstrating first-hand the capabilities and innovative design of CELL.

José Francisco Tárraga García, CEO of Ideatec, emphasizes that this project represents a milestone in acoustic innovation. For its part, Summumstudio has been key in the integration of design and functionality, redefining the way spaces are perceived and experienced.

With 35 years of experience and presence in more than 50 countries, Ideatec continues to lead the industry with high-performance solutions for ceilings, walls and cladding. Its products, certified by entities such as FSC, PEFC and LEED, combine technology, sustainability and innovative design, positioning the company as a reference in the field of architectural acoustics.
