

»Next Gen« Buffing

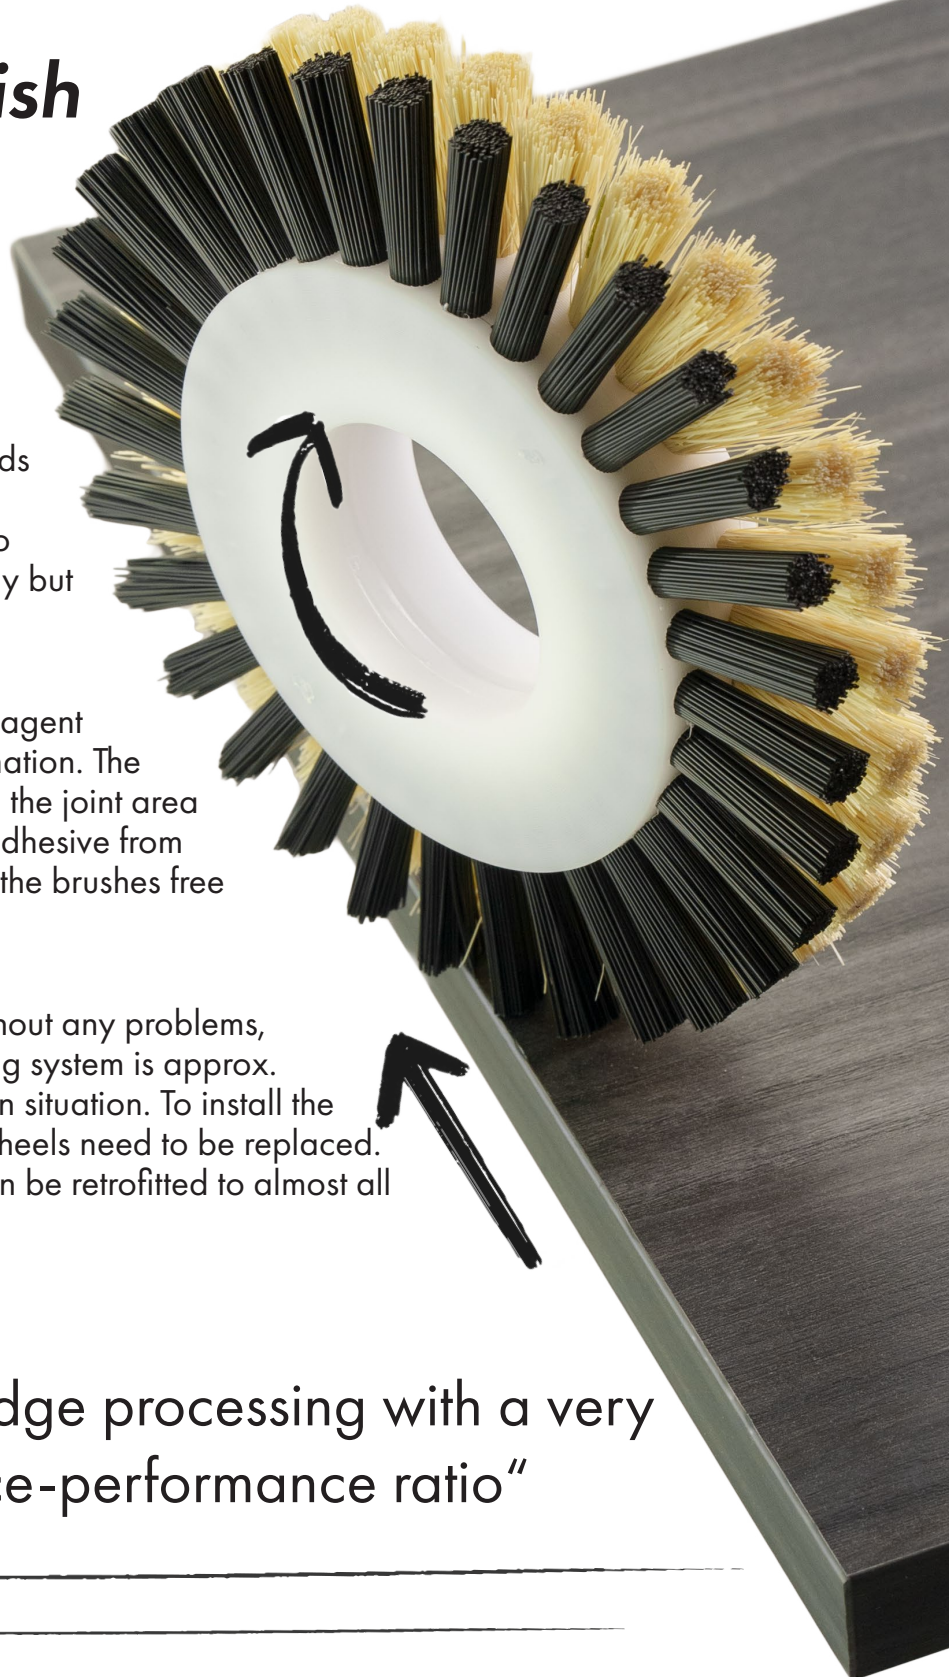

with *Texture Finish*

Upgrade for your existing buffing unit. Thanks to the construction and a coordinated fibre combination, impurities in the joint area are removed and previously applied, process-relevant liquids are absorbed. Smooth and deeply structured surfaces, as well as matt to high-gloss decors, are cleaned gently but effectively.

Texture Finish consists of a release agent spraying system and a brush combination. The brushes remove adhesive residues in the joint area and the release agent prevents the adhesive from sticking to the workpiece and keeps the brushes free of dirt.

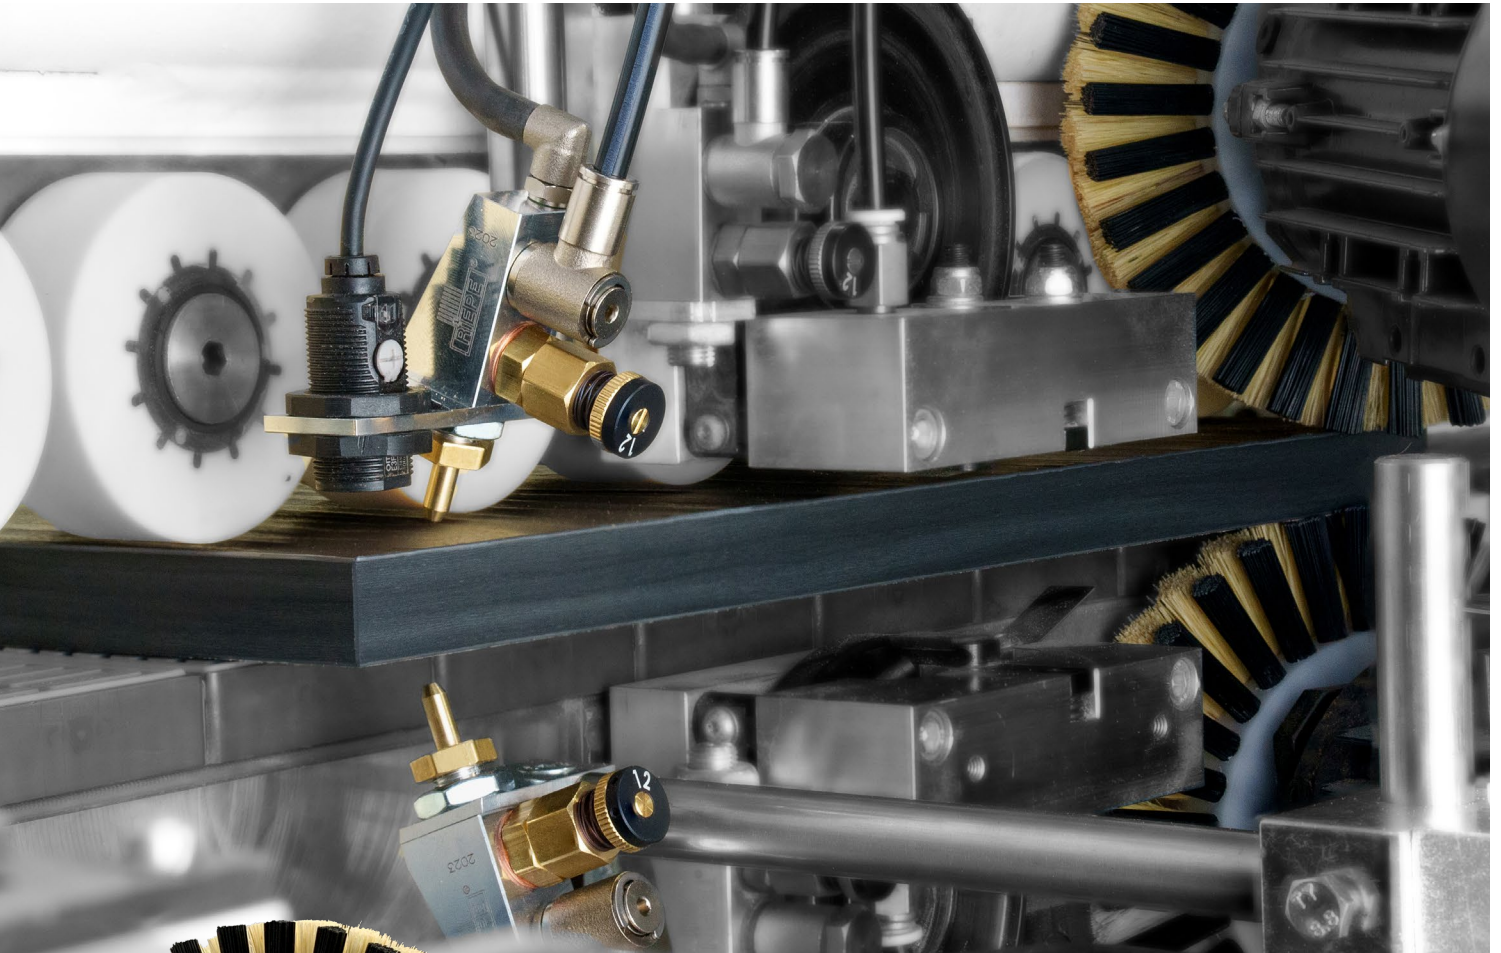

Generally, retrofitting is possible without any problems, as the space required for the spraying system is approx. 80 mm, depending on the installation situation. To install the brush set, only the existing buffing wheels need to be replaced. This design means that the system can be retrofitted to almost all edge banding machines.

„Residue-free edge processing with a very good price-performance ratio“

System setup

Edge banding machine

Contents:

- Brush set, consisting of a combination of polyamide and fibre
- Spraying system incl. control unit (24V or 230V) and photo sensor
- Release agent LP120/12® with connection set and matching holder

Available dimensions:

- 160x24x50mm

Can be attached to almost any motor with the RIEPE® universal adapter
