Monitor your sites remotely with Fireco's new software

Fireco is excited to be starting the year off by introducing a new innovation to its product range! This product has been developed throughout 2020 with the aim of being able to help customers operate more efficiently, reduce costs and meet compliance requirements.

Introducing InSite, Fireco's open and unified monitoring software and the newest addition to the Pro Range.

The InSite software is cloud-based, offering remote monitoring of Fireco's Pro Range door devices, providing real-time information about the status, battery life and signal strength through the ProHub system controller.

This software is an excellent way for Installers and Maintenance Managers to keep track of their different sites, enabling them to plan visits efficiently around the device reports.

InSite is also ideal for Building Managers, Facility Managers or even the Responsible Person for fire safety, who want to be able to ensure their building is compliant without physically having to check.

"I've worked with installers for 10 years and I know they will find this software invaluable for remote monitoring, system checks on-site and even pre-empting when a service is required. Ensuring critical areas of a building are compliant is of great importance and has been a hot topic in the industry this past year. InSite makes keeping buildings safe easier than ever." Alex Stone, Commercial Services Manager.

We are planning to exhibit at FIREX in July and the Fire Safety Event in September, where we will be showcasing InSite, along with other Pro Range devices. However, we are also carrying out online product demonstrations, so no one misses out.

For more information about InSite or to sign up to a demo visit www.fireco.uk/insite or call Fireco on 01273 320650.
