Case Study: Napoleon's Casino

Introduction

A few years ago, the gaming section of the A&S Leisure Group Limited decided to move out their London Leicester Square Casino premises. They already had casino premises at their head offices in Sheffield plus others in Bradford, Leeds and Hull. They fixed their sights on Manchester city centre, and the meticulous planning commenced. One of the areas of planning for the premises was security and access control.

The Solution

Alongside an extensive Axis CCTV system, an Axis intercom system was installed. While contracters are granted access to the staff entrance using a pre-issued card, casino staff use an ievo ultimate™ biometric fingerprint reader.

The project was supported by Brock Business Support, who designed and quoted the system and project managed the installation. The installers were AD Systems Ltd of Blackpool.

Brock.
Business Support

ievo ultimate™ is a CPNI-certified biometric fingerprint reader equipped with a best-in-class multi-spectral imaging (MSI) sensor. MSI scans deeper into the fingerprint than standard optical sensors, analysing both the surface and sub-surface levels and capturing highly accurate images.

The accuracy of MSI means that even when obscured by levels of dirt, moisture, or damage, fingerprints can still be identified.
