

Case Study: Distribution Centre

PROBLEM

The distribution centre did not have a unified fire roll call system. This was because there are multiple tenants on site operating multiple different access control systems.

SOLUTION

Although there were many different tenants, there was a common premises entry/exit point shared by all. At this point, an independent access control system was installed by RamCo Solutions, including ievo biometric fingerprint readers.

In addition, the system was integrated with the distribution centre's existing fire alarm system. In the event of a fire alarm activation, this would provide a centralised automatic roll call printout of all the staff on site.

ievo ultimate™ is vandal resistant and suitable for external installation.

IP65 IK10

In this case, the ievo fingerprint readers provided accurate staff presence recording via biometric verification, whilst also prioritising convenience for the site staff by eliminating the need to carry an additional access card.

**Robert Alex Ramsey, Director,
RamCo Solutions**

As well as the ievo readers installed on the gate, they are also mounted on CDVI's GNP-1L lorry-height goose neck posts.
