

PRESS RELEASE

Intelligent access control with Turnitec

Waregem, 24 October 2013

Turnstiles are commonly used for access control. Due to the complexity of the product there are only a handful of players on the market. This obligates the gate manufacturer to buy standard solutions and make concessions to the uniformity of his gates and fences. Locinox now offers the perfect solutions for these gate manufacturers with their innovative and fully modular turnstile mechanism: the Turnitec.

With the Turnitec any gate manufacturer can now make a high quality and maintenance free turnstile. He now has an (electro)mechanical unit at its disposal and he can match the design of his turnstile with the design of his gates.

The Turnitec mechanism is applicable to any turnstile and a fast installation is guaranteed. Thanks to the 100% modular (electro)mechanical design, one can compose the system by the wishes of each individual client. The optional damping system guarantees a comfortable and safe working, unaffected by temperature changes. A wide range of combinations is possible, here are two possible configurations:

Mechanical control : This version offers the advantage that it can work 100% autonomous without the supply of electricity and or communication cables. The release or closing of a rotational direction is easily done by means of a key contact. People can access or leave the terrain through the turnstile by pushing the arms of the turnstile.

Electromechanical control: With the electromechanical version the operator has the possibility to intelligently control the in- and outflow. Opening and closing, rotational direction and access control can all be controlled with a simple push on the button. The turnstile is unlocked and allows access to the terrain or building after authorization by the visitor.

Let's make better fences together

A 100% safety is guaranteed with minimum staff costs. Fail-open and Fail-close settings are both possible and all modules can be combined. One can put a mechanical module for exit control and an electromechanical module for control over the entrance. Or one can simply install the base module which allows the turnstile to rotate freely in both directions.

Locinox , situated in Waregem - Belgium, is an internationally renowned company developing products specially designed for the gate and fencing business. High-quality , ease of installation and innovation are the main trumps of the company in a market where products are used in extreme (weather)conditions.
