

HURDLE

Epigenetics and the science behind biological age clocks - InflammAge as a case study

Lisa J. Schmunk, PhD
Research & Development Manager

Visit us at stand B38

Today's agenda:

~20 min presentation

~10 min Q&A

1. Introduction to the world of Science & Epigenetics
2. Deep dive into Epigenetics and Ageing
3. What epigenetic clocks can tell us about our health
4. InflammAge as a case study
5. The role of epigenetics clocks in the diagnostic journey
6. Summary
7. Q&A

Biology in a nutshell - Nature vs Nurture

Our bodies are made up of **cells**, each with the same **DNA** inside that we inherit from our parents.

Our **genetic makeup** is fixed at birth

- DNA code ATCG, 3 billion letters per copy, 23 x 2 chromosomes

Central dogma of Biology:

- **DNA -> RNA -> Protein**
- **Gene** = stretch of DNA that can be “expressed” to create a functional product (e.g. an enzyme)

Epigenetics refers to the layer of non-genetic influences on gene expression and can change over time.

What is epigenetics?

What is epigenetics?

Chromosome

- **Definition:**

Molecular variation that is beyond changes in the DNA sequence, that is inherited after cell division and that regulates gene expression.

DNA methylation.

Histone modifications.

Others (non-coding RNAs?).

Epigenetics and physiology

HURDLE

Modern Ageing - Lifespan vs healthspan

- **We are living longer:**

Almost 2X lifespan since 200 years ago.

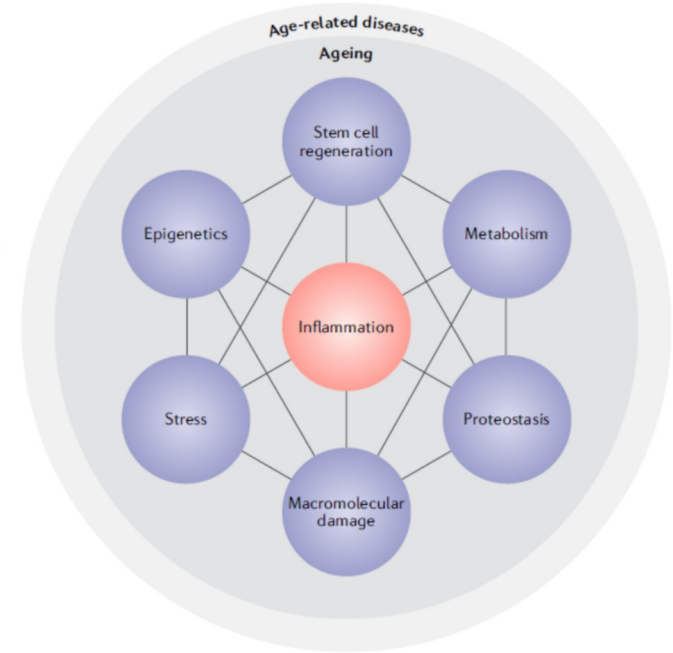

- **Yet sicker: rise of NCDs:**

Cardiovascular, cancer, diabetes, neurodegenerative, ...
Largely preventable through lifestyle interventions.

Focus → extend healthspan.

HURDLE

Ageing is composed of many molecular mechanisms (hallmarks)

- How can we measure biological ageing?

DNA methylation - the archetypal epigenetic modification

- The first molecular epigenetic mechanism discovered (early as 1948)
- **DNA methyltransferase (DNMT)** enzymes - attach methyl group to carbon 5 of cytosine on CpG motifs
- Most common cytosine modifications in mammals are 5-methylcytosine (5-mc) and 5-hydroxymethylcytosine (5-hmc)

- There are *circa* 30 million CpG sites across the human genome
- Methylation of CpG sites can promote or repress gene expression

Measuring the ageing process with epigenetics

Nature Rev. Mol. Cell Biology, vol. 16, no. 10, pp. 593–610, 2015.

- **Epigenetic clocks:**

The most accurate biomarkers of the ageing process.

They measure your biological age.

Development of anti-ageing therapies.

Chronomics epigenetic clock → saliva

Epigenetic clocks and their clinical relevance

- **Epigenetic age acceleration (EAA)** is associated with meaningful variables in humans.

Biological aging methylation 'clocks'

Clinical

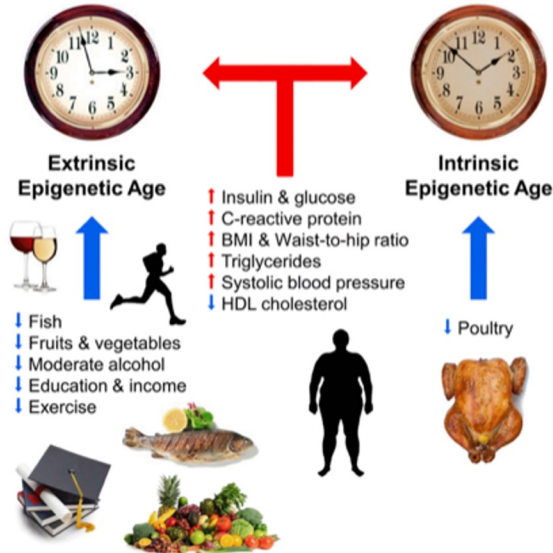

- All-cause mortality
- Obesity
- Cancer
- Cardiovascular disease
- Alzheimer's
- Werner's syndrome
- Huntington's disease
- Down syndrome
- Sotos syndrome
- HIV infection
- ...

Nat. Review Genetics, vol. 19, pp. 371-384, 2018.

Epigenetic clocks and their clinical relevance

- **Epigenetic age acceleration (EAA)** is associated with meaningful variables in humans.

Pre-clinical / lifestyle factors

Aging, vol. 9, pp. 419-446, 2017.

Epigenetic clocks to track intervention success

Preventive healthcare and epigenetics - InflammAge

- At **Hurdle** we trained a novel DNA methylation aging clock using biologically informed by features related to systemic chronic inflammation. This work was supported by Bayer Consumer Health
- First biomarker of its kind rooted in biology of chronic inflammation and epigenetic aging
- Non-invasive and accessible saliva test
- Easily deployable as screening self test
- Captures long term inflammation trends (think HbA1c vs glucose)
- Actionable measurement of a major driver of biological-age related chronic disease risk

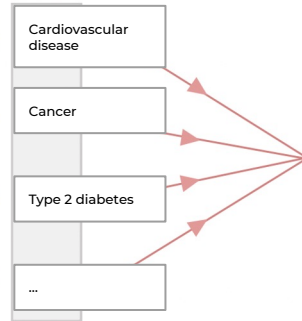

HURDLE

Preventive healthcare and epigenetics - InflammAge

Ageing mechanism

Disease

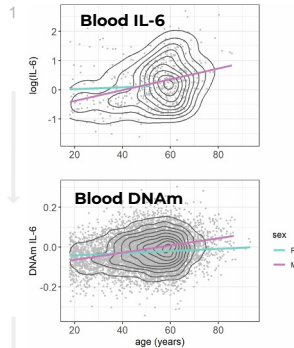

Mortality Rate

Preventive healthcare and epigenetics - InflammAge

Built saliva DNAm proxies
for blood SCI markers

Higher correlation with age
Less sensitive to confounders (e.g. acute inflammation)

Higher accessibility and scalability

Trained age predictor ML model
using 42 SCI saliva DNAm proxies:
novel InflammAge biomarker
N=338, MAE=3.8337

Preventive healthcare and epigenetics - InflammAge

Built saliva DNAm proxies
for blood SCI markers

Trained age predictor ML model
using 42 SCI saliva DNAm proxies:
novel InflammAge biomarker
N=338, MAE=3.8337

InflammAge acceleration is associated with:

- Blood markers out of clinical reference ranges (N=61)
- Chronic pro-inflammatory disease (HIV, N=46control+142HIV)
- Inflammatory conditions in GS biobank (N= c.20,000)

Predictor	n_event	Prop Female	mean_age_case	sd_age_case

We demonstrated actionability
with InflammAge reduction in a
nutraceutical interventional trial
(N=18)

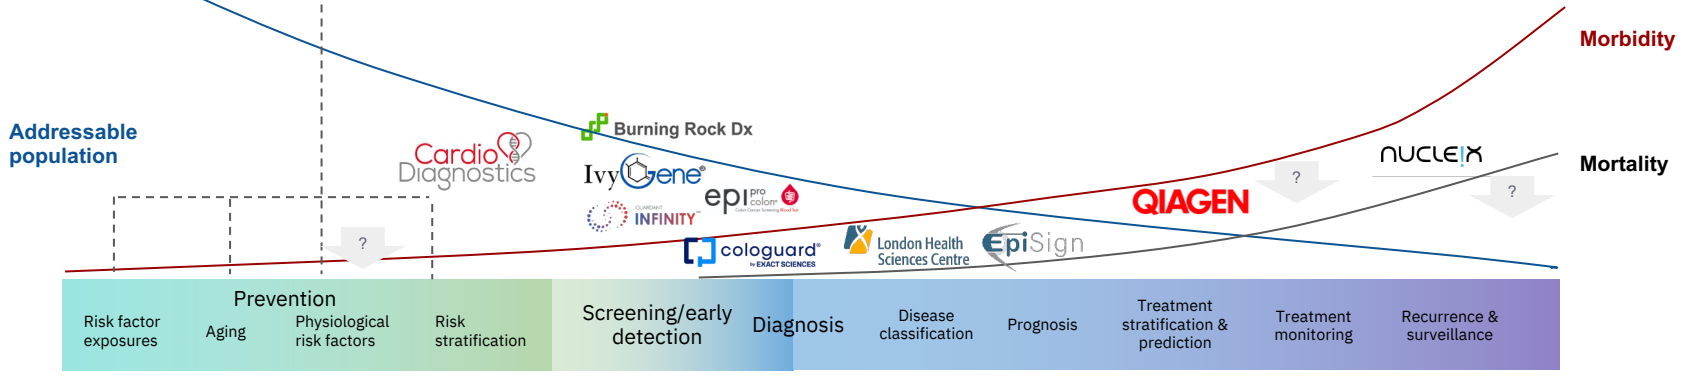

Preventive healthcare and epigenetics

Prevention/risk

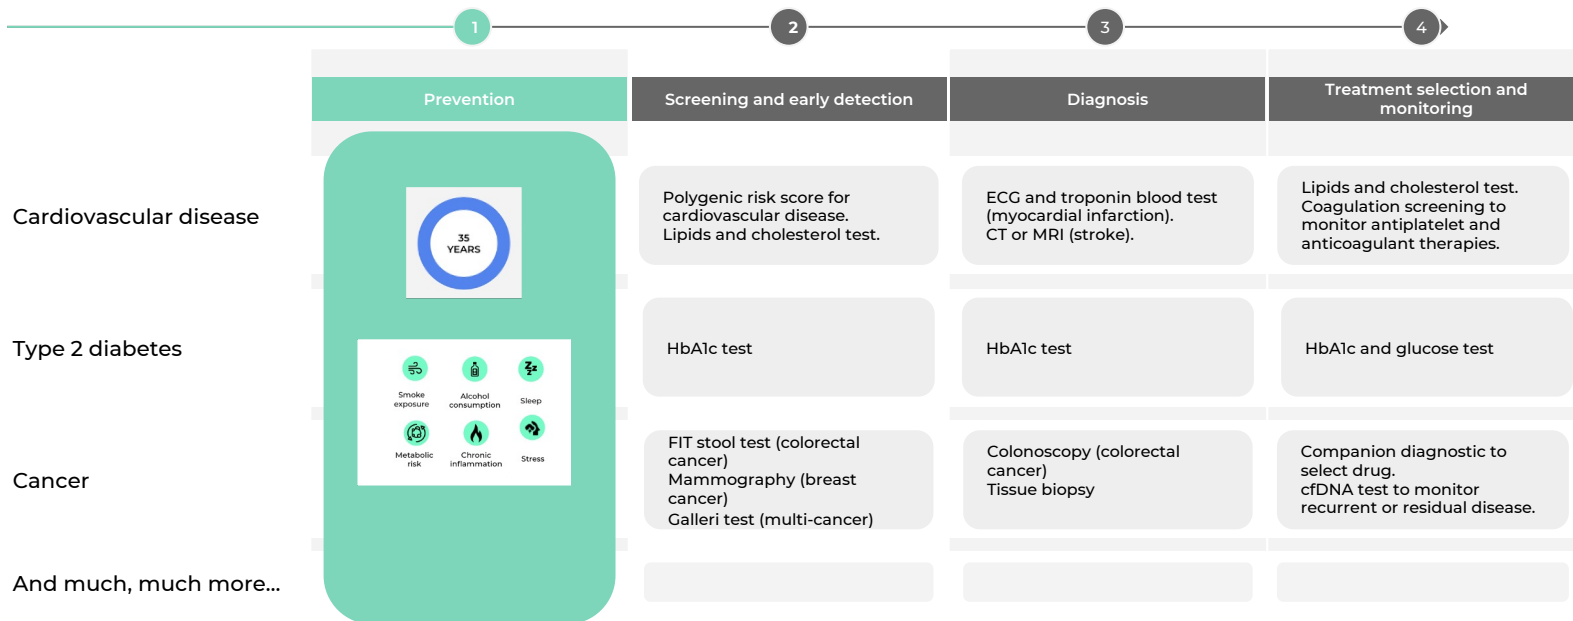

HURDLE

- AI/ML models for risk factor quantification - 1000s of DNAm sites
- Integrate environmental risk exposures, aging, physiological stress with genetics
- Classified as wellness test by FDA - faster to market + wider reach
- Validate as risk stratification biomarkers against clinical endpoints
- Risk factors become actionable focus - earlier pre-clinical intervention - prevention of morbidity

HURDLE

Deconvoluting epigenetic biological age for preventative healthcare

Summary

1. Epigenetics can **integrate** genetics and environment to quantify complex traits like aging and disease risk
2. DNA methylation is an **accessible, dynamic data source** for next gen AI/ML built biomarkers
3. Biological age biomarkers such as **InflammAge** can track the effect of interventions
4. DNA methylation biomarkers could link **prevention, risk stratification, and early detection** for tomorrow's population-health screening strategies
