THE AMM SERIES:

With incorporated
bending modules

- For the production of engineering, construction and mesh with openings for prefabricated concrete elements
- With two types of bending units:
 - servo-driven multi-function modules for bending of individually selected line & cross wire overhands on the openings and perimeter of the mesh
 - and/or: bending stations for the simultaneous bending of all line & cross wires.
- Any type of mesh can be produced instantly without any adjustments
- Processing up to 12mm, 16mm or 20mm coiled material (based on machine version)
- Line and cross wires are fed fully automatic by two FLEXI-LINE hyperbolic rotor straightening and cutting machines with up to six different diameters and automatic convergence diameter changing system (Patented)
- Different line and cross wire diameters and lengths can be welded in the same mesh.
- No downtime when changing: Coils - Spacing - Diameters - Mesh dimensions
