Typical Use Cases

Precise Finetuning

Speech Analytics

Perform comprehensive and highly complex content analysis of speech. Uncover demographic information about a speaker (including their age, gender, language, and dialect), track the interactions between a client and a contact center's agent and detect cross-talking, silent spots, call topics, and other important business insights automatically.

Voicebot Enabler

Provide customers with a frictionless customer experience powered by Phonexia's cuttingedge voice biometrics and speech technologies. Integrate Phonexia technologies into voice-enabled solutions and transform ordinary IVRs into smart IVRs, secure voicebot solutions with voice verification, and offer seamless selfservice over the phone.

Phonexia Speech Engine comes with a built-in dictionary for custom words, which can be easily used to improve speech transcription accuracy by adding the words not included in the default dictionary such as product names, dialectspecific words, slang phrases, and others. It can also be used to add alternative pronunciations of the words already present in the dictionary to accommodate local and dialect specifics.

Phonexia Speech Engine enables the defining of an unlimited number of single- or multi-word phrases expected to appear during speech. Such words are then favored over similarly sounding words or phrases, greatly improving the speech transcription accuracy. It is particularly useful for voicebot scenarios, where specific words and phrases are preferred in the speech transcription of an answer to a particular question.

Integration Possibilities

Interface

Phonexia's cutting-edge speech and voice biometrics technologies are powered by **Phonexia Speech Engine**, which is distributed as a **RESTful** server application.

Evaluation

Phonexia Speech Engine's technologies can be quickly evaluated using a rich-GUI Phonexia application and an evaluation license.

Deployment

Phonexia Speech Engine can be deployed on premises or in a virtualized environment.

Recommended Hardware

For production deployment, a 64-bit server processor is recommended with a higher L3 cache (the higher, the better). For example, the Intel[®] Xeon[®] processors E5/E7/Gold/Platinum or Intel[®] Core[™] processors i5/i7/i9.

Hardware configuration depends on the use case scenario. Phonexia provides advanced consultation upon a request.

🔹 intel. MARKET READY

License Distribution Options

- HW profile licensing key **On-premises installation**
- Licensing server On-premises or cloud-based installation
- NET-based license For evaluation and testing purposes

Input Formats

- WAV or RAW (PCM unsigned 8 or 16 bits, IEEE float 32-bit, A-law or Mu-law, ADPCM)
- FLAC
- OPUS
- 8 kHz+ sampling frequency (other audio formats are automatically converted)

Supported OS

- Windows 64-bit (x86_64)
- Linux 64-bit (x86_64)

Supported Languages
