

**DIDWW**

Remove the boundaries

# Full PSTN replacement

Building blocks for an innovative communication solution

# What is PSTN replacement?

With the exponential growth of the Internet and the advancement of IP-based technologies, VoIP (Voice over Internet Protocol) has become the preferred choice for communications, fully replacing the traditional PSTN (Public Switched Telephone Network) and providing an array of new functionalities for the modern-day user.

# By replacing traditional PSTN telephony with VoIP, you will benefit from:

## Reduced communication costs

As there is **no hardware** required and the **call rates are lower** when using cloud telephony, companies can drastically reduce their communication expenses by switching to VoIP.

## Greater scalability

Internet-based solutions are **easier and much faster to scale** up and down depending on the immediate business requirements.

## Effortless business expansion

VoIP technology enables you to rapidly and cost-efficiently **expand your business to multiple offices**, locally or internationally.

# By replacing traditional PSTN telephony with VoIP, you will benefit from:

## Extensive features and functionalities

When using VoIP, companies have access to a **wide range of features**, such as time-based call routing, voicemail, voice menus, pre-recorded messages, conference calling, fax to email, call recording, and much more.

## Remote capabilities

As long as you have access to mobile data or a Wi-Fi connection, you can utilize VoIP and **take your calls wherever you are** using a smartphone, tablet or PC.

# By replacing traditional PSTN telephony with VoIP, you will benefit from:

## Ease of use

VoIP solutions are a lot more sophisticated than traditional on-site telephony systems, yet they are **easy to use** and allow rapid configuration updates.

## Integration with other platforms

In most cases, VoIP telephony can seamlessly be **integrated with existing business systems**, such as CRMs, marketing platforms and more.
